## ACKNOWLEDGEMENTS

On behalf of the national research team at Public Health and Reforms Center of Ministry of Health, we would like to thank Dr. Zakiyya Mustafayeva and whole team of Ministry of Health and all the doctors and nurses in the regions of Azerbaijan that worked very hard to help us reach out to respondents, perform all necessary measurements and raise awareness about NCDs among the populations throughout the survey.

We are grateful Dr. Joao Breda and Dr. Bente Mikkelsenfrom WHO Regional Office for Europe for their trust in us to initiate and successfully complete the STEPS survey in Azerbaijan, to Dr. KamranGaraxanov and his wonderful WHO/Azerbaijan office team for their tremendous support that enabled us to achieve all the objectives of this interesting STEPS survey to study risk factors of NCDs in Azerbaijan.

Our special thanks to Dr. Ivo Rakovac,Dr. Enrique Loyola, Martin W. Weber, Stefan Savin and whole team of WHO office in Russian Federation for the help and cooperation and for sharing their experience and best practices that have helped us to successfully organize STEPS survey in Azerbaijan.

By determining the prevalence of NCD risk factors with this survey, evidence-based data is now provided for setting the priorities and planning necessary interventions and actions to engrain healthy attitudes of our people in the coming years. Furthermore, it reiterates again the necessity to raise public awareness of healthy lifestyle and to develop and activate integrated policy of urban planning and nutrition, to expand international co-operation to learn best practices for tackling NCDs, to promote training and education for healthcare workers at all levels but with focus on primary healthcare and to distribute the sectorial funding efficiently for non-communicable disease prevention and control.

We would like to use this opportunity and invite all of you to read through the results of this important report and think deeply of the way you as an individual and we as a team, as an organization and as a community should lead the research and work in protecting and promoting population health.

## EXECUTIVE SUMMARY

The Ministry of Health underthe technical and financial support of the World Health Organization (WHO)and other partners conducted the Stepwise approach to surveillance (STEPS) survey in 2017. The WHOSTEPS approach focuses on obtaining core data on the established risk factors that determine the major non-communicable disease burden. This approach to chronic disease risk factor surveillance provides an entry point for the country to get started on chronic disease surveillance activities.

There are three different levels of "steps" of risk factor assessment. These steps are questionnaire (step 1); physical measurements (step 2) andbiochemical measurements (step 3). Step 1 covers questions on demographic information, and behavioral measurements focusing on tobacco use, alcohol consumption, diet, physical activity, history of raised blood pressure, history of diabetes, history of raised total cholesterol, history of cardiovascular disease, lifestyle advice and cervical cancer screening for women. Step 2 covers blood pressure measurement, height, weight, waist circumference and heart rate. Step 3 focuses on blood glucose and lipids measurement.

- The prevalence of tobacco use, both smoked and smokeless combined, was $24.0 \%$. Overall, 48.8 \% of men were estimated to be current smokers, with $47.2 \%$ being daily smokers and $1.6 \%$ non-daily smokers. Only $0.2 \%$ of women reported smoking at the time of the interview. The percentage of current smokers among men was higher in the younger age group (49.3\%), as compared to the elder age group (47.8\%). The survey revealed a slight difference in the percentage of current male smokers in urban (49.2\%) and rural ( $48.3 \%$ ) areas by place of residence. The survey showed that men started smoking from 18.7 years, with almost no difference between male age groups: 1834 and $45-69$ years ( 18.3 vs. 19.4 years respectively). Mean duration of smoking among daily smokers of men was 20.4 years. Mean duration of smoking for older respondents was higher than younger group (33.9 vs. 13.1 respectively). $95.1 \%$ among daily smokers reported usage of manufactured cigarettes. The mean number of manufactured cigarettes smoked per day by daily smokers was 18.9 for all age groups. Among currently smoking male respondents about $49.5 \%$ had tried to stop smoking during the last year. Nearly quarter respondents (24.9\%) at home and about one in five (18.3\%) of respondents at the workplace were exposed to second-hand smoke during the 30 days preceding the survey.
- Approximately $29.7 \%$ of all respondents reported ever consuming an alcoholic drink in their lives with the remaining $70.3 \%$ being lifetime abstainers. Current drinking ("past 30-days drinkers") was almost exclusively occurring among males $27.6 \%$ and as
opposed to $0.8 \%$ among females. $11.0 \%$ of men reported consumption of six or more drinks ("heavy episodic drinking") at least once during the last 30 days. Current drinker men consumed on average 3.6 drinks per drinking occasion in the past 30 days.
- As far as diet was concerned the respondents consumed on average fruits and vegetables generally low: fruits 5.1 days and vegetables 5.9 days during a typical week. Consumption of both fruits and vegetables was more frequent in older age groups.WHO recommends that an adult should consume five or more servings of fruitsand/or vegetables a day. However, only $24.1 \%$ of respondents consumed the recommended 5 servings of fruits and/or vegetables in a day. Women respondents and urban citizens consumed fruits and vegetables more than menand respondents living in rural areas. About $26 \%$ of the respondents reported that they always add salt before or when eating. On average Azerbaijan citizens consume 10 grams of salt per day, almost double the WHO recommendedlevel of $5 \mathrm{~g} /$ day, with significant gender difference mean salt intake: $11.4 \mathrm{~g} /$ day of men versus $8.6 \mathrm{~g} /$ day of women.
- Almost one in 5 individuals (19\%) did not meet WHO recommendations on physical activity for health. There was no noticeable difference between the age groups and the male and female sex, but there was a visible difference between the place of residence, where urban population less meet WHO recommendation than rural citizens. Median duration of all physical activity carried out daily recorded by all respondents was 129 minutes; 146 minutes for men and 120 minutes for women. About $91 \%$ of women is not engaging in vigorous physical activity (men - almost 72\%).
- Only about one in ten (11\%) women aged 30-49 years have ever had a screening test for cervical cancer.
- More than half of respondents reported receiving healthy lifestyle advice from a doctor or a healthworker during the past three years.
- Mean BMI of the study populationwas 26.0, mean BMI for women (26.4) was higher than for men (25.5). Mean BMI was higher in the older age group of respondents and among rural citizens. According to BMI risk assessment, almost $34.8 \%$ of the population was overweight (BMI 25.0-29.9), and 20.6\% was obese (BMI $\geq 30.0$ ). The prevalence of overweight and obesity tended to increase with age.The proportion of overweight or obese women in all age groups was higher compared to their male counterparts. Mean waist circumference among men was higher than women, excluding pregnant - 92.3 versus 88.2.
- Mean systolic blood pressure among the survey population was 125.9 mmHg , with the higher values found in men ( 127.0 mmHg ). Mean DBP was 81.2 mmHg , with slightly differences between the sexes. Almost $33 \%$ of respondents reported that their blood pressure had never been measured. The prevalence of arterial hypertension (systolic
blood pressure $>140 \mathrm{mmHg}$ and/or diastolic blood pressure $>90 \mathrm{mmHg}$ or included those currently using medication) among the entire sample was almost $30 \%$. About $65.4 \%$ of respondents with increased blood pressure were not taking any medication, with the proportion of men (72.0\%) being higher than that of women (59.2\%).
- Around $72 \%$ of respondents had never had their blood glucose measured. The prevalence of diabetes within the preceding 12 months was $4.2 \%$ (men $3.1 \%$, women $5.3 \%$ ) and $0.5 \%$ diagnosed, but not within past 12 months. Mean fasting blood glucose was $4.6 \mathrm{mmol} / \mathrm{L}$, with no differences between men and women. The prevalence of impaired fasting glycaemia (IFG) ( $\geq 5.6 \mathrm{mmol} / \mathrm{L}$ and $<6.1 \mathrm{mmol} / \mathrm{L}$ ) was $5.0 \%$ (men $5.0 \%$, women $4.9 \%$ ). Levels of IFG in urban area for all respondents was more than in rural area almost twice. The prevalence of diabetes mellitus, (fasting blood glucose $\geq 6.1$ $\mathrm{mmol} / \mathrm{L}$ or taking antidiabetic medication), for all respondents was $6.5 \%$ (women significantly more than men - $7.9 \%$ vs. $5.2 \%$ respectively).
- It was also established that about one in ten individuals (12.5\%) had a raised total cholesterol level ( $\geq 5 \mathrm{mmol} / \mathrm{L}$ or taking medication for hypercholesterolemia), with the proportion of women (13.3\%) being higher than that of men (11.9\%).
- The percentage of those aged 40-69 years with a 10-year cardiovascular risk of greater than $30 \%$ or with existing cardiovascular disease (CVD) was $12.6 \%$ being $13.3 \%$ for males and $12.0 \%$ for females.
- The survey showed that about every third person (32.5\%) had three or more risk factors for noncommunicable diseases, and this increased proportionally with age. Men were more affected ( $40.0 \%$ ) than women ( $24.9 \%$ ). A total of $61.7 \%$ of respondents had $1-2$ risk factors, and only $5.8 \%$ of the population studied had none of the five risk factors for noncommunicable diseases.
- The percentage of drivers or passengers of a motor vehicle who did not always use a seat belt during the past 30 days was $53.0 \%$. This indicator was higher for women (67.1\%) compared to men (40.8\%).

## BACKGROUND

## Noncommunicable disease (NCDs) worldwide

Noncommunicable diseases (NCDs), also known as chronic diseases, tend to be of long duration and are the result of a combination of genetic, physiological, environmental and behavioral factors.NCDs are a group of conditions that cover cardiovascular diseases, cancer, mental health problems, diabetes mellitus, and chronic respiratory disease.

These diseases are driven by forces that include rapid unplanned urbanization, globalization of unhealthy lifestyles and population ageing. Unhealthy diets and a lack of physical activity may show up in people as raised blood pressure, increased blood glucose, elevated blood lipids and obesity. These are called metabolic risk factors that can lead to cardiovascular disease, the leading NCD in terms of premature deaths. For the first time in history, more people are dying of noncommunicable diseases, such as heart disease and diabetes, than infectious diseases. Seven in 10 deaths globally every year are from NCDs, and according to WHO reports, the main contributors here are tobacco use, harmful use of alcohol, unhealthy diets, and physical inactivity.

Currently, NCDs present $43 \%$ of global morbidity, and more than $60 \%$ of all deaths worldwide. In 2015, an estimated 40 million deaths occurred due to NCDs, accounting for $70 \%$ of the total 56 million deaths. The majority of such deaths were caused by the four main NCDs, namely: cardiovascular disease, 17.7 million deaths (accounting for $45 \%$ of all NCD deaths); cancer, 8.8 million deaths (22\%); chronic respiratory disease, 3.9 million deaths (10\%); and diabetes, 1.6 million deaths (4\%).

NCDs represent a leading threat to human health and economic development. The burden of NCDs is rapidly increasing, especially in developing countries, and their social, economic and health consequences will be significant. Over $80 \%$ of deaths resulting from CVDs and diabetes, almost $90 \%$ of deaths from chronic obstructive pulmonary disease and more than two thirds of deaths from cancer occur in low- and middle-income countries.

Many lives can be saved from NCDs through early diagnosis and improved access to quality and affordable treatment, as well as a whole-of-government approach to reduce the main risk factors. Some investigations proved that when NCD risk factors are recognized, understood and prevented, the stroke rate can be reduced by 80 percent and cancer rate by 40 percent, while type-2 diabetes can be totally prevented. An estimated 2.5 million deaths could be prevented each year if global salt consumption were reduced to the recommended level.

Tobacco is a leading cause of morbidity and mortality globally. Tobacco - including both tobacco use and second-hand smoke - is responsible for more than 6 million deaths annually. Smoking is estimated to cause about $71 \%$ of lung cancer, $42 \%$ of chronic respiratory disease and $10 \%$ of CVD. In 2015, more than 1.1 billion people smoked tobacco, with far more males than females currently engaging in this behavior. The WHO Framework Convention on Tobacco Control has now been ratified by 180 Parties representing $90 \%$ of the global population.

About $4.5 \%$ of the global burden of disease and injury is attributable to alcohol. Alcohol contributes to traumatic outcomes that kill or disable people at a relatively young age, resulting in the loss of many years of life, as well as disability and deaths. Harmful use of alcohol causes about $3.8 \%$ of all deaths each year. More than half of these deaths occur from NCDs, including liver cirrhosis, cancer and CVD. Harmful use of alcohol is the leading risk factor for death in men aged 15-59 years. The worldwide level of alcohol consumption in 2016 was 6.4 liters of pure alcohol per person aged 15 years or older, with considerable variation between WHO regions.

Low consumption of fruit and vegetables is associated with higher risk for CVDs, and stomach and colorectal cancers. High salt consumption is an important determinant of high blood pressure and CVD risk. High consumption of saturated fat and trans-fat is associated with increased risk for heart disease and stroke.

Physically inactive people have a $20-30 \%$ increased risk for all-cause mortality. Raised body mass index (BMI) increases the risk for heart disease, strokes, diabetes and certain cancers.

Raised blood pressure is the leading risk factor for global disease burden. It is estimated to cause 9.4 million deaths every year - more than half of the estimated 17 million annual deaths from all CVDs. Raised blood cholesterol is estimated to cause 2.6 million deaths annually. Both are major risk factors for CVD and stroke.

## NCDs in AzerbaijanRepublic

Several studies have been conducted recently by the Ministry of Health of Azerbaijan Republic on NCDs: "Situational Analysis of NCD in Azerbaijan" (2008), "Economic Impact of NCD in Azerbaijan" (2009), the "Global Youth Tobacco Survey" (GYTS-2011), the "Global Youth Tobacco Survey" (GYTS-2017), the "National Survey on NCD Risk Factors" (2011), "Research of NCD Risk Factors in Azerbaijan"(2016) and a comparative analysis to evaluate the relevance of the Azerbaijan legislation on tobacco control to requirements of the WHO Framework Convention on Tobacco Control (conducted in 2015, updated in 2016). Besides, some figures
related to NCD diseases, have been obtained during Azerbaijan Demographic and Health Surveys, which took place in 2006 and 2011 years.

According to the information collected, as in most countries, NCDs are a major cause of deaths and morbidity in Azerbaijan. Moreover, there is a high prevalence of risk factors such as smoking, overweight and unhealthy diet, which are responsible for the vast majority of NCD cases. Regarding "National Survey on NCD Risk Factors" (2011), $62.7 \%$ of the adult population has at least 1-2 risk factors for developing an NCD, whereas $32.4 \%$ has three or more. According to the State Statistical Committee of Azerbaijan, as of the end of 2016, the following diseases were the leading six causes of deaths in Azerbaijan:

1. Diseases of Cardiovascular system - 34093 (60\%)
2. Neoplasms / Cancers - 8252 (15\%)
3. Diseases of the digestive system - 2794 (5\%)
4. Injury, poisoning and certain other consequences of external causes - 2731 (5\%)
5. Diseases of endocrine system, including diabetes, and malnutrition - 1433 (2.5\%)
6. Diseases of the respiratory system -1815 (3.2\%)

Most of these diseases are attributed to common preventable risk factors such as tobacco use, excessive alcohol consumption, unhealthy diet, and physical inactivity.

In Azerbaijan now is implementing "National Strategy of Azerbaijan Republic on Prevention and Control of Non-Communicable Diseases 2015-2020", signed by the President of Azerbaijan in December, 2015.The main goal of the National NCD Strategy, to be based on "European Strategy on NCDs Prevention and Control" and "Action Plan of Global Strategy on NCDs Prevention and Control" is by prevention of premature death and by declining burden of the NCDs to improve quality of life and prolong life-expectancy of local population, to strengthen labor resources and economic potential of the country. Implementation of the NCDs Strategy is one of the prioritized tasks included in the "Azerbaijan2020: Look into the future" concept of development, which was approved bythe President of the Republic of Azerbaijan on 2012.

As a continuation of efforts in reducing risk factors, the new Law of Azerbaijan Republic "On restriction of tobacco use" was approved by the President of Azerbaijan on December, 2017. The new Law includes broader issues of tobacco control, including those related to creating smoke-free public places, tobacco advertising, promotion and sponsorship ban, and others. The adoption of such comprehensive bill will raise effective tobacco control in Azerbaijan, including measures necessary to protect people from exposure to second-hand tobacco smoke. Moreover, it is expected that after adoption of new bill the positive changes will affect to all related tobacco control Laws in Azerbaijan.

## Prevalence of NCD risk factors in AzerbaijanRepublic

Smoking is still a problem for the Azerbaijan society. In Azerbaijan, men smoke extensively, while women and children are mostly exposed to second hand smoke. The Azerbaijan State Statistical Committee data reported $35.5 \%$ prevalence of smoking among men (15+).

Azerbaijan has conducted several national surveys to monitor progress on tobacco control. Findings from NCD 2011 Survey (18 years and above) in Azerbaijan show that the total prevalence of smoking was overall $22.9 \%$. This prevalence was higher for men (48.7\%) than for women ( $0.5 \%$ ), the possibility on underreporting among female respondents cannot be excluded. The greatest smoke exposure was found at workplaces for men (55.0\%) and at homes for women (40.2\%).

Data from GYTS - 2016 (13-15 years) indicated that over 10\% students had ever smoked cigarettes, with significantly higher rates among boys. Current tobacco use rates were lower $7.3 \%$. Close to three in 10 students live in homes where others smoke, and $40.8 \%$ of students are exposed to smoke in enclosed public places (27.3\% in 2011).

Regarding NCD 2011 Survey 14.3\% of adults are regular alcohol users in Azerbaijan. Results in DHS 2006 show that $40 \%$ of men age 15-59 consumed at least one alcoholic beverage in the month prior to the interview.

Although Azerbaijan is known for its rich vegetables and fruits, more than 40\%of people do not consume these products daily. Majority of the population ( $84.9 \%$ ) consume less vegetable and fruit than the recommended daily intake by the WHO with no significant differences between the age and gender groups.

According to results of National Survey of risk factors for chronic noncommunicable diseases in Azerbaijan (2011) the mean body mass index (BMI) was 27.0 with women having higher BMI than men ( 27.6 vs. 26.5 respectively). The proportion of the respondents classified as overweight and obese was $35.8 \%$ and $21.9 \%$ respectively. The obesity was substantially more prevalent among women than men ( $27.2 \%$ vs. $16.4 \%$ ).

According to survey data the other widely spread risk factor in Azerbaijan is high blood pressure. This is one of the most important modifiable risk factors for cardiovascular diseases such as heart attack, myocardial infarction, acute coronary syndrome, congestive heart failure, strokes, kidney disease, and peripheral vascular disease. Overall, 872 out of 2000 respondents had raised blood pressure or were taking medicines for hypertension. Of them, $7.5 \%$ were on medication and had their blood pressure controlled, $34.6 \%$ were taking drugs for raised blood
pressure but did not have it controlled, and, finally, $57.9 \%$ were not taking any anti-hypertensive medicines and did not have their blood pressure under control. Around half of women were on medication, whereas only slightly about the third of men were on treatment. Taking into account prevalence and rising input of these risk factors on burden of diseases in the country there is need to analyze their national and regional level trends.

## SURVEY GOAL AND OBJECTIVES

## Survey goal

The goal of the second national survey was to provide up-to-date information using WHOapproved methods by assessing the prevalence, current situation and future tendencies of NCD causes and risk factors among the Azerbaijani population.

## Survey objectives

The objectives of the survey were:
$\star$ To obtain the current levels of risk factors and the prevalence of behavioral risk factors for NCDs in the population aged 18 to 69 years in Azerbaijan
$\star$ To determine the difference in the prevalence of risk factors between sexes, areas of residence and across age groups.
^ To assess the progress in implementation of the national and global action plans
$\star$ To track the direction and magnitude of trends in NCD risk factors
$\star$ To support the planning and evaluation of NCD strategy, policy and programinterventions

## Rationale for the survey

In AzerbaijanRepublic there is no permanent monitoring system to monitor risk factors, and existing statistic data from State Statistic Committee of Azerbaijan Republic (SSC)are fragmentary and unsystematic.In order to obtain relevant data, the first nationwide WHO STEPS survey in Azerbaijan republic was conducted in 2011. The findings of this national survey provided the evidences for developing of the National Strategy on NCDI, and the NCDI surveillance system in country. In 2016 Ministry of Health of Azerbaijan republic conducted "Research of NCD Risk Factors in Azerbaijan" in line with implementation plan of NCD Strategy. This survey partially used STEPS methodology.

The nationwide WHO STEPS 2017 survey was the second one of conducted in Azerbaijan with use of the WHO STEPS methodology. This survey provided the opportunity to compare results and determine changes, if any, in the prevalence of behavioral risk factors of NCDs and in policies associated with them.

The survey was conducted in accordance with WHO methodology that provides comparable information on the prevalence of risk factors for NCDs in different countries across the world.

## SURVEY METHODOLOGY

## The STEPs Approach

The survey used STEPS approach recommended by WHO for surveillance of NCDs and associated risk factors. It is based on the three sequential steps of data collection on NCD risk factors.

Each step focused on a particular set of data which is subdivided into three main categories: core items, expanded items and optional items. Data on core items should be collected in any country setting. Expanded items and optional items are subjects of human resource, logistics and financial limitations.

The step one core items include information on basic demographic data, tobacco use, alcohol consumption, fruit and vegetable consumption, consumption of salt, physical activity, history of raised blood pressure diabetes, raised total cholesterol and cardiovascular diseases, lifestyle advice and cervical cancer screening.

The step two core items include the following physical measurements: blood pressure, height and weight and waist circumference.

The step three core items include the following biochemical measurements: fasting blood sugar, total cholesterol and urinary sodium andcreatinine.

## Concept of WHO STEPwise approach

WHO STEPS also contain eSTEPS a software package and set of specific tools to enter data in electronic format. This method brings several important advantages: no paper forms needed,
built-in range checks and determined flow of data collection, simpler preparation of dataset for analyses.

It is recommended to conduct STEPS survey once in five years taking into account resource limitations thus establishing surveillance system on determined risk factors.

## Sampling procedure

Overall 2880 individuals participated in the study. The age groups of the STEPS survey were based on the Global Burden of Disease (GBD) age groups. There were 2 age groups 18-44 and 45-69 years per gender. (1)

The sample size has been calculated using the formula:
$\mathrm{n}=Z^{2} \frac{P(1-P)}{e^{2}}$
Z - probability value for $95 \%$ confidence interval (1.96)
P - estimated prevalence of the risk factors (0.5)
e - margin of error (0.05)
The calculation resulted in the sample size $\mathrm{n}=384$.
Then the sample size was adjusted for the design effect with the recommended value of 1.5 for majority of complex STEPS studies. $\mathrm{n}=384$ * $1.5=576$

In addition the sample size was adjusted for the four age-sex groups used in the STEPS survey simply by multiplying sample size by their number. $n=576$ * $4=2304$

Also, the sample size was adjusted for the anticipated non response by dividing sample size to the recommended anticipated response rate of $80 \%$ thus obtaining the final sample size. $\mathrm{n}=$ $2304 / 0.8=2880$

The study used stratified three-stage cluster design. The primary sampling units (clusters) were proportionally selected among all economic regions of Azerbaijan excluding Nakhchivan Autonomous Republic and occupied territories. The STEPS survey used database of the Central Election Commission.

On the first stage, based on the resource availability 240 clusters were selected with probability proportional to cluster size from the database. 135 clusters represented urban areas and 105 one's rural areas.

On the second stage secondary selection units (households) were selected in each cluster using simple random sampling approach. The number of households selected within each cluster was 12.

On the third stage the tertiary selection units (individuals) were selected in each household using simple random sampling approach. There was selected just one individual within each household.

The sample allocation structure is presented below:
240 clusters $\times 12$ households $\times 1$ individual $=2880$ individuals
To increase the quality of survey results the data were weighted to adjust for the probability of selection (sample weight) and differences between the sample population and target population (population weight).

STEPS sample by economic region

| S/N | Economic Region | \# Households <br> (thsd.) | \# Clusters | \# Households in <br> sample |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Baku | 517.4 | 64 | 768 |
| 2 | Absheron | 120.9 | 17 | 204 |
| 3 | Ganja-Qazakh | 261.7 | 35 | 420 |
| 4 | Shaki-Zaqatala | 132.3 | 16 | 192 |
| 5 | Lankaran | 164 | 24 | 288 |
| 6 | Quba-Khachmaz | 110.5 | 14 | 168 |
| 7 | Aran | 389.7 | 55 | 660 |
| 8 | Yukhari-Karabakh | 95.1 | 7 | 84 |
| 9 | Daglilg-Shirvan | 60.1 | $\mathbf{7 8 5 1 . 7}$ | $\mathbf{8}$ |
|  | Total: |  | $\mathbf{2 4 0}$ | 96 |

The survey was conducted from May 2017 to March 2018. The data were collected during two months 24 August 2017-24 October 2017. The response rate was $97.3 \%$ ( 2801 respondents).

## Instrument and data collection

WHO STEPS Instrument for Noncommunicable Disease Risk Factor Surveillance was used for data collection. The STEP1 included all core as well as expanded items. The STEP2 also included all core as well as expanded items. The STEP3 included all core measurements as well as measurement of triglycerides.In addition "Tobacco Policy", "Violence and Injury" and "Mental health/Suicide" optional modules were added into survey: Translation was made into Azerbaijan language.

The STEP1 collected demographic information and behavioral measurements. The corresponding questionnaire included data on tobacco use, alcohol consumption, diet, dietary salt, physical activity, history of raised blood pressure, history of diabetes, history of raised total
cholesterol, history of cardiovascular diseases, lifestyle advice and cervical cancer screening (for women only).

The STEP2 collected physical measurements. They included blood pressure, height and weight, waist, hip circumference and heart rate.

The STEP3 collected biochemical measurements. They included blood glucose, blood lipids, urinary sodium and creatinine and triglycerides.

Interviewers used show cards adapted to local context while asking questions about tobacco use, alcohol consumption and diet. There were developed six show cards describing typical local tobacco products, three show cards describing common portions of alcohol and six show cards with examples of fruits, vegetables and juices.

Information for STEP1 and STEP2 was collected within household setting. Regional executive power authorities allocated personnel that assisted survey teams in locating household and establishment of initial contact. During the visit interviewers also provided instructions on taking urine sample together with urine container to the survey participant. The STEP3 biochemical measurements except urinary sodium and creatinine were made in the specifically allocated medical facility which survey participants visited in the next morning. In case of distant villages, the survey team visited participant again in the next morning to take biochemical measurements except urinary sodium and creatinine within household setting. The results of biochemical analyses except urinary sodium and creatinine were recorded into tablet. Urine samples were analyzed centrally by EuroLab company. As per signed contract the company was responsible for delivery of urine samples and their analyses. EuroLab company recorded results of analyses of urine samples into separate database. This database was merger to survey database after all analyses of urine were completed. The merging was made on QR code which was unique to every participant.

Every survey team had tablet SAMSUNG Galaxy Tab 4 OS8 which was equipped with STEPS software package provided by WHO. The software had built-in range checks as well as skip patterns and was used for recording survey data. QR code was assigned to every participant in order to uniquely identify him/her within the database. The survey data were accumulated on the distant server provided by WHO.

Four supervisors were assigned for the monitoring of the field work and facilitation of data collection process. The data collection process was monitored on constant base. The geolocation means allowed realizing monitoring up to particular household address. Information on the course of the field work was shared with all interested organizations.

## Data downloading and analyses

WHO expert conducted training on data analyses for the team of Center of Public Health and Reforms responsible for data analyses and reporting. The training took place on 12-16 December 2017

The data cleaning was done in accordance with WHO recommendations. Mainly it was focused on the exclusion of duplicate records. This problem was caused with unstable internet in rural areas.

After database had been approved by WHO expert it was exported in Excel format. There were three separated excel files each representing data for particular STEP. All three files were merged together to comprise final database for analyses. The results were calculated as means or percentages with corresponding $95 \%$ confidence intervals.

The analyses were done using Epi Info version 3.5 .3 software package.

## Ethical consideration

Interviewer had to obtain informed consent from the survey participants before data collection. There were two consent forms to be signed by participants. One is for STEP1 and 2 and the other is for STEP3. All signed forms are stored in the archive of the Center of Public Health and Reforms. The access to archive is restricted to the authorized personnel only.

## SURVEY RESULTS

## Demographic indicators

This chapter of the study report presents the findings and data analysis results of the information gathered on demographic indicators such as age, gender, education, marital status, ethnicity, occupation, household income of survey respondents.

Table 1 presents the distribution of the study participants by gender and age groups. Survey populationconsisted of 2801 respondents aged 18-69 years represented all administrative units in the Azerbaijan Republic. The Nakhichevan districts and occupied territories did not participate in the survey. Overall, the share of female respondents was higher than male ( $59.4 \%$ and $40.6 \%$ respectively). Of the 2801 respondents, 1136 were menand 1665 were women. By age group, $45 \%$ were in the 18-44 years age group ( 1265 individuals)and $55 \%$ wereaged $45-69$ years (1536individuals). In terms of residence, 1568 people were from urban areas (56\%) and 1233 from rural areas (44\%) (Figure 1).

Table 1. Distribution of respondents, by age and sex

| Age Group (years) | Men |  | Women |  | Both Sexes |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | n | \% | n | \% |
| 18-44 | 525 | 41.5 | 740 | 58.5 | 1265 | 100 |
| 45-69 | 611 | 39.8 | 925 | 60.2 | 1536 | 100 |
| 18-69 | 1136 | 40.6 | 1665 | 59.4 | 2801 | 100 |

Figure 1. Distribution of respondents, by age,sex and area of residence

Of all the survey respondents, $92.8 \%$ were Azerbaijani, $3.1 \%$ were Talish, $2.1 \%$ Lezgi,and $2.0 \%$ were from other ethnic groups.
A total of $73.5 \%$ of the study population were married, $13.3 \%$ had never been married, $9.4 \%$ were widowed, $2.0 \%$ were divorced, $0.3 \%$ were cohabitating and $1.5 \%$ were separated. Theprevalence of respondents that had never been married was higher among men (16.2\%) than women (11.3\%).The proportion of people divorced was almost 3.6 times higher among women ( $2.9 \%$ ) than among men ( $0.8 \%$ ), and the proportion of people widowed was four times higher among women ( $13.5 \%$ ) thanamong men (3.4\%).

Table 2. Marital status of respondents, by age and sex

| Sex | N | \% Never <br> married | \% Currently <br> married | \% <br> Separated | \% Divorced | \% Widowed | \% Cohabiting |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1120 | 16.2 | 78.7 | 0.7 | 0.8 | 3.4 | 0.3 |
| Women | 1639 | 11.3 | 69.9 | 2.0 | 2.9 | 13.5 | 0.3 |
| Both <br> sexes | $\mathbf{2 7 5 9}$ | $\mathbf{1 3 . 3}$ | $\mathbf{7 3 . 5}$ | $\mathbf{1 . 5}$ | $\mathbf{2 . 0}$ | $\mathbf{9 . 4}$ | $\mathbf{0 . 3}$ |

The mean number of years spent in education was 11.6 years with schooling years longer in men than in women (12.1 and 11.2 respectively) (Table 3). Younger agegroup (18-44) tended to have slightly more years of schooling in comparison with older age group (45-69) (11.7 and 11.4 respectively).

Table 3. Mean number of years of education, by age and sex

| Age Group (years) | Men |  | Women |  | Both Sexes |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean | n | Mean | n | Mean |
| 18-44 | 525 | 12.0 | 740 | 11.5 | 1265 | 11.7 |
| 45-69 | 611 | 12.1 | 923 | 11.0 | 1534 | 11.4 |
| 18-69 | 1136 | 12.1 | 1663 | 11.2 | 2799 | 11.6 |

$42.8 \%$ of respondents reported to have completed College/University. The proportion of female respondents who did not attend any formal school was greater in comparison to male respondents ( $0.8 \%$ vs. $0.4 \%$ respectively). Comparison of education level by sex denoted that men were more likely to have completed a university or postgraduate degree, while women were more likely to have completed high school or secondary school. Interestingly, the greatest proportion of College/University educated people was observed in 45-69 years age group, and this finding was consistent for both sexes (see Annex 4).

Table 4. Highest level of education, by sex

| Sex | n | \% No <br> formal <br> schooling | \% Less <br> than <br> primary <br> school | \%Primary <br> school <br> completed | \%Secondary <br> school <br> completed | \%High <br> school <br> completed | \%College/ <br> University <br> completed | \% Post <br> graduate <br> degree <br> completed |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1136 | 0.4 | 0.1 | 0.8 | 8.8 | 38.8 | 49.2 | 1.8 |
| Women | 1663 | 0.8 | 0.8 | 3.1 | 12.3 | 43.4 | 38.4 | 1.2 |
| Both <br> sexes | $\mathbf{2 7 9 9}$ | $\mathbf{0 . 7}$ | $\mathbf{0 . 5}$ | $\mathbf{2 . 2}$ | $\mathbf{1 0 . 9}$ | $\mathbf{4 1 . 5}$ | $\mathbf{4 2 . 8}$ | $\mathbf{1 . 5}$ |

The survey results show that less than half ( $42.5 \%$ ) were employed. There were almost twice as many the number of working men as more than women ( $60.9 \%$ vs. $29.9 \%$ respectively). Only $22.1 \%$ of respondents weregovernment employees, $13.9 \%$ were not government employees and $6.5 \%$ were self-employed. Around $42 \%$ of the female respondents were housewives.

Table 5. Employment status, by sex

| Sex | n | \% Government employee | \% Non-government employee | \% Self-employed | \% Unpaid |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1128 | 21.5 | 25.6 | 13.8 | 39.1 |
| Women | 1651 | 22.6 | 5.8 | 1.5 | 70.1 |
| $\mathbf{1 8 - 6 9}$ | $\mathbf{2 7 7 9}$ | $\mathbf{2 2 . 1}$ | $\mathbf{1 3 . 9}$ | $\mathbf{6 . 5}$ | $\mathbf{5 7 . 5}$ |

One in every six respondents was unemployed despite being able to work. The share of such persons was two times greater among men than among women ( $23.0 \%$ vs. $11.4 \%$ ) and was decreasing with age (See Annex.4).
There were $57.5 \%$ retired and $13.9 \%$ students among unpaid work and unemployed respondents.

TAbLe 6. UNPAID WORK AND UNEMPLOYED, by SEX

| Sex | n | \% Non-paid | \% Student | \%Home- <br> maker | \% Retired |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1128 | 21.5 | 25.6 | 13.8 | 39.1 |
| Women | 1651 | 22.6 | 5.8 | 1.5 | 70.1 |
| $\mathbf{1 8 - 6 9}$ | $\mathbf{2 7 7 9}$ | $\mathbf{2 2 . 1}$ | $\mathbf{1 3 . 9}$ | $\mathbf{6 . 5}$ | $\mathbf{5 7 . 5}$ |

Out of 2801 respondents, 2246 ( $80.1 \%$ ) responded to the household incomequestion. The average per capita annual income was 1800 Azerbaijani manat.

Table 7. Mean annual per capita income

| $n$ | Mean |
| :---: | :---: |
| 2246 | 1800 |

## Tobacco use

Tobacco use was measured by asking respondents separate sets of questions to gather information on smoke and smokeless tobacco use. Respondents were grouped into current smokers and non-smokers.

Current smokers were respondents who smoked any tobacco products (e.g. cigarettes, cigarsor hand-rolled tobacco) in the past 30 days. Current smokers were composed of daily smokers and non-daily smokers. Daily smokers were those who smoke tobacco products every day; and non-daily smokers those current smokers who smoke tobacco products on non-daily basis.Non-smokers consisted of those who never smoked and former smokers; never smokedreferred to those who had never smoked tobacco products, whereas former smokers were thosewho had quit smoking. Categorization of smoking status in such groups actually facilitates the addictive characteristics of tobacco.

The percentage of current smokers of all tobacco products amongall respondents was $24.0 \%$ ( $95 \% \mathrm{Cl}$ : 21.9-26.1). One in every two men was a current smoker, whereas only $0.2 \%$ of women (4 individuals) reported smoking at the time of the interview. Considering very low prevalence of smoking among female respondents, hereinafter, more detailed information related to smoking was presented to men only.The percentage of current smokers among men was higher in the younger age group ( $49.3 \%, 95 \% \mathrm{Cl}$ : 44.3-54.3) vs. in the elder age group (47.8\%, 95\% CI: 43.3-52.3)(Table 8).

Table 8. Percentage of current smokers, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | $\qquad$ <br> Curren smoker | 95\% CI | n | \% Current smoker | 95\% CI | n | \% Current smoker | 95\% CI |
| 18-44 | 275 | 49.3 | 44.3-54.3 | 740 | 0.2 | 0.0-0.4 | 1265 | 24.8 | 22.0-27.6 |
| 45-69 | 282 | 47.8 | 43.3-52.3 | 925 | 0.3 | 0.0-0.7 | 1536 | 22.7 | 20.1-25.3 |
| 18-69 | 557 | 48.8 | 45.1-52.5 | 1665 | 0.2 | 0.0-0.4 | 2801 | 24.0 | 21.9-26.1 |

The Figure 2 showsa slight difference in the percentage of current male smokers in urban and rural areas by place of residence ( $49.2 \%, 95 \% \mathrm{CI}: 44.1-54.4$ vs $48.3 \%, 95 \% \mathrm{CI}: 42.8-53.8$ ).

Figure 2. Percentage of current tobacco users among men, by age and area of residence (\%)

Overall, 48.8 \% ( $95 \% \mathrm{CI}: 45.1-52.5$ ) of men were estimated to be current smokers, with 47.2\% ( $95 \% \mathrm{CI}: 43.5-50.9$ ) being daily smokersand $1.6 \%(95 \% \mathrm{CI}: 0.8-2.4$ ) non-daily smokers. It was also estimated that $41.4 \%$ ( $95 \% \mathrm{Cl}$ : 37.6-45.2) had never smoked and 9.8\% (95\% CI: 7.9-11.8) wereformer smokers. The number of former smokers was substantially different among age groups (Table 9).

Table 9. Smoking status of men, by age

|  | n | Current smoker |  |  |  | Non-smokers |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | \% Daily | 95\% CI | \% Nondaily | 95\% CI | \% Former smoker | 95\% CI | \% Never smoker | 95\% CI |
| 18-44 | 525 | 47.6 | 42.6-52.6 | 1.7 | 0.6-2.9 | 6.4 | 4.2-8.6 | 44.3 | 39.2-49.4 |
| 45-69 | 611 | 46.4 | 41.9-51.0 | 1.4 | 0.4-2.3 | 16.0 | 12.7-19.3 | 36.1 | 31.6-40.7 |
| 18-69 | 1136 | 47.2 | 43.5-50.9 | 1.6 | 0.8-2.4 | 9.8 | 7.9-11.8 | 41.4 | 37.6-45.2 |

The survey showed that men started smoking from 18.7 ( $95 \% \mathrm{Cl}$ : 18.3-19.2) years. There was almost no difference between male age groups (18-44 and 45-69) in terms of the mean age of starting smoking (18.3 vs. 19.4 respectively) (Table 10).

Table 10. Mean age started smoking, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean age | 95\% CI | n | Mean age | 95\% CI | n | Mean age | 95\% CI |
| 18-44 | 261 | 18.3 | 17.8-18.9 | 2 | 21.0 |  | 263 | 18,3 | 17,8-18.9 |
| 45-69 | 267 | 19.4 | 18.6-20.3 | 2 | 15.6 |  | 269 | 19,4 | 18,6-20.2 |
| 18-69 | 528 | 18.7 | 18.3-19.2 | 4 | 18.4 |  | 532 | 18,7 | 18,3-19.2 |

As shown in Table 11, mean duration of smoking among men daily smokers is 20.4 (95\% CI: 19,1-21.7) years. Mean duration for older respondents is higher than younger group ( 33.9 vs 13.1 respectively).

Table 11. Mean duration of smoking, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean duration | 95\% CI | n | Mean duration | 95\% CI | n | Mean duration | 95\% CI |
| 18-44 | 261 | 13,1 | 12,0-14.2 | 2 | 3.8 |  | 263 | 13,1 | 12,0-14.1 |
| 45-69 | 267 | 33,9 | 32,8-34.9 | 2 | 34.1 |  | 269 | 33,9 | 32,8-34.9 |
| 18-69 | 528 | 20,4 | 19,1-21.7 | 4 | 18.3 |  | 532 | 20,4 | 19,1-21.7 |

$95.1 \%(95 \% \mathrm{CI}: 91,3-98,9)$ of daily smoker'smen reported using manufactured cigarettes.

Percentage of current smoker men using different products distributed as follows: manufactured cigarettes - $94.9 \%$, cigars $-5.6 \%$, shisha $-4.8 \%$, hand-rolled cigarettes $-1.8 \%$, pipes of tobacco $-1.8 \%$ and others $-1.3 \%$.

The mean number of manufactured cigarettes smoked per day by daily smokers was 18.9 (95\% CI: 17.6-20.2) for all age groups. The highest number of cigarettes smoked per day among men was found in the age group 45-69 years in comparison with age group 18-44(21.3 vs. 17.9 respectively)(Figure3).

Figure 3. Mean number of manufactured cigs among men, by age and area of residence

The majority of daily smoker's men (49.8\%) smoked 15-24 cigarettes per day(Fig. 4). Almost third (31.1\%) of men in age group 45-69 smoked 25 and more cigarettes daily.

Figure 4.Percentage of daily men smokers smoking manufactured or hand-rolled cigarettes PER DAY (\%)

About half (49.5\%, $95 \% \mathrm{Cl}$ : 43.9-55.1) of currently smoking male respondents tried to stop smoking during the last year.

The survey found that only31.2\% of male respondents among those smokers who had visited a doctor or other health worker in the past 12 months had been advised to stop smoke (Table 12).

Table 12. Current smokers who have been advised by doctor to stop smoking, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Among all male respondents, only $0.2 \%(95 \% \mathrm{Cl}: 0.0-0,5)$ were current users of smokeless tobacco.

Approximately $24.9 \%$ of all respondents were exposed to second-hand smoke athome. Surprisingly, men were more exposed than women ( $26.5 \%$ vs $23.3 \%$ ). The overall rate of exposure to second-hand smoke at home for both sexes was higher in the young age group than older (26.6\% vs 22.1)(Table 13).

Table 13. Exposed to second-hand smoke at home during the past 30 days, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | N | $\begin{gathered} \% \\ \text { Exposed } \end{gathered}$ | 95\% CI | n | $\begin{gathered} \% \\ \text { Exposed } \end{gathered}$ | 95\% CI | n | $\begin{gathered} \% \\ \text { Exposed } \end{gathered}$ | 95\% CI |
| 18-44 | 525 | 29,2 | 23,6-34,8 | 740 | 24,0 | 19,3-28,6 | 1265 | 26,6 | 22,4-30,8 |
| 45-69 | 611 | 21,8 | 17,7-25,8 | 925 | 22,4 | 18,4-26,4 | 1536 | 22,1 | 18,9-25,3 |
| 18-69 | 1136 | 26,5 | 22,3-30,7 | 1665 | 23,3 | 19,6-27,1 | 2801 | 24,9 | 21,6-28,2 |

But in the workplace, only $18.3 \%(95 \% \mathrm{CI}: 15.0-21,6)$ respondents from both sexes were exposed to second-hand smoke. As expected, men were more exposed than women ( $28.4 \%$ vs.7.7\% respectively). Differences between age groups(18-44 and 45-69) for all respondents is notable (19.7\% vs $16.0 \%$ respectively) (Table14).

TABLE 14. EXPOSED TO SECOND-HAND SMOKE IN THE WORKPLACE DURING THE PAST 30 DAYS, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |

| 18-69 | 860 | 28,4 | 23.0-33,9 | 1205 | 7,7 | 5,5-9,9 | 2065 | 18,3 | 15.0-21,6 |

## Tobacco Policy

The tobacco policy was assessed as optional modules. Participants were asked whether they had seen any information on the dangers of smoking cigarettes or that encouraged quitting smoking in print (newspapers or magazines) and electronic media (TV and radio).

During the past 30 days before the survey, $31.9 \%$ ( $95 \% \mathrm{CI}: 27.8-36.0$ ) of respondents noticed information aboutthe dangers of smoking or information that encouraged quitting in newspapers or magazines; $66.6 \%$ ( $95 \% \mathrm{CI}$ : 61.9-71.3) noticed such information on television; and 33.6\% $95 \% \mathrm{Cl}$ : 29.0-38.1) noticed such information on the radio. Differences between age groups (1844 and 45-69) were not notable, but they wereslightly significant between gender groups of the respondents with regard to all mass media sources. Men noticed these warning messages more than women.

Among the current smokers, $89.4 \%$ ( $95 \% \mathrm{CI}$ : 85.7-93.1) respondents noticed health warnings on cigarette packages duringthe 30 days preceding the survey. Of this group, $41.4 \% ~(95 \% \mathrm{Cl}$ : 35.7-47.1) had thought about quitting influenced by thehealth warnings they saw on cigarette packages.

The figure below shows the percentage of all respondents who noticedcigarette promotion during the past 30 days (Figure 5).

Figure 5. Percentage of response about types of cigarette promotion, by sex (\%)

## Alcohol consumption

The respondents were asked to indicate their alcohol consumption status, that is, if they consumed alcohol and if so, the frequency and quantity of the alcohol consumed.

Approximately $29.7 \%$ of all respondents reported ever consuming an alcoholic drink in their live with the remaining $70.3 \%$ being lifetime abstainers. The proportion of lifetime abstainers was two times greater as among women than men - $94.5 \%$ ( $95 \% \mathrm{Cl}: 40,3-50,1$ ) vs. $45.2 \%(95 \% \mathrm{CI}$ : 92,8-96,2) respectively.

Respondents who reported having consumed alcohol within the past 30 days were defined in the survey as current drinkers, and they were $13.9 \%$ ( $95 \% \mathrm{Cl}$ : 12.1-15.8)among all respondents.Current drinking was almost exclusively occurring among males $27.6 \%$ ( $95 \% \mathrm{Cl}$ : 23.9-31.3) as opposed to $0.8 \%$ ( $95 \% \mathrm{CI}: 0.4-1.3$ ) among females. Due to the low number of women consuming alcohol within the past year the results for women were omitted from some of the tables below.Differences between age groups (18-44 and 45-69) are notable (26.7 vs 29.2 respectively) (Table 15).

TAble 15. Alcohol consumption status among men, by age

|  | n | \% Current drinker (past 30 days) | 95\% CI | \% Drank <br> in past <br> 12 <br> months, <br> not <br> current | 95\% CI | ```% Past 12 months abstainer``` | 95\% CI | \% Lifetime abstainer | 95\% CI |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 18-44 | 525 | 26,7 | 22.0-31,4 | 12,8 | 8,9-16,8 | 10,3 | 7,4-13,2 | 50,2 | 44,4-56.0 |
| 45-69 | 611 | 29,2 | 25.0-33,5 | 13,9 | 10,6-17,2 | 20,6 | 16,5-24,7 | 36,2 | 31.0-41,5 |

The survey observed a slightly greater percentage of current drinkers in rural areas among men that had consumed alcohol in the past 30 days $-28.4 \%$ ( $95 \%$ CI: 23.2-33.7), while in urban areas this figure was $26.9 \%$ ( $95 \% \mathrm{CI}$ : $21.6-32.0$ ) (Figure 6).

Figure 6. Percentage of alcohol consumption status among men, by age and area of residence (\%)

Percentage of former drinkers (those who did not drink during the past 12 months), who stopped drinking due to health reasons, such as a negative impact of drinking on their health or as per advice of a doctor among men, was $41.2 \%$ ( $95 \%$ CI: 31.4-50.9), among women was $18.5(95 \% \mathrm{CI}: 4,1-32,8)$. The proportion with this indicator among men was found to increase from $36.8 \%$ ( $95 \% \mathrm{Cl}$ : $22.8-50.8$ ) in the age group 18-44 years to $45.1 \%(95 \% \mathrm{Cl}: 34.1-56.1$ ) in those aged 45-69 years (Table 16).

Table 16. Stopping drinking due to health reasons, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |

| 18-44 | 61 | 36,8 | $\begin{gathered} 22,8- \\ 50,8 \end{gathered}$ | 27 | 20,1 | $\begin{aligned} & 0,7- \\ & 39,5 \end{aligned}$ | 88 | 32,9 | 88 |
| 45-69 | 129 | 45,1 | $\begin{gathered} 34,1- \\ 56,1 \end{gathered}$ | 31 | 16,1 | $\begin{array}{r} 2,4- \\ 29,8 \\ \hline \end{array}$ | 160 | 40,7 | 160 |
| 18-69 | 190 | 41,2 | $\begin{gathered} \hline 31,4- \\ 50,9 \end{gathered}$ | 58 | 18,5 | $\begin{aligned} & 4,1- \\ & 32,8 \end{aligned}$ | 248 | 36,8 | 248 |

The study population responded to the question about frequency of alcohol consumption in the past 12 months.Among those respondents who drank in the last 12 months $1.7 \%$ ( $95 \% \mathrm{Cl}$ : 0,52,8 ) of men drank alcohol every day. 49,4\% ( $95 \% \mathrm{CI}$ : 43.4-55.4) of respondents for both sexes were consumed alcohol less than once a month. Only 37 women answered this question and among them $92.8 \%$ ( $95 \% \mathrm{Cl}$ : 86,6-98,9) drunk alcohol less than once a month. No any visible differences in the proportion of all respondentswho drank alcohol on 5-6 days or on 1-2 days per weekwere among age groups (Figure 7).

Figure 7. Frequency of alcohol consumption in the past 12 months both sexes, by age (\%)

In the past 30 days current alcohol drinkers among men had consumed 3.9 occasionswith at least one drink ( $95 \% \mathrm{Cl}: 3.3-4.5$ ) and this figure among women was 1.8 occasions $(95 \% \mathrm{Cl}$ : $1.0-2.5)$. The highest average number of drinking occasions for both sexes was registered in the age group 45-69 years ascompared with 18-44 (4.3 vs 3.7 respectively).

The survey found that that the mean number of drinking occasions among rural population was higher than among the urban one ( $4.2,95 \% \mathrm{Cl}: 3.4-5.0$ vs 3.5 ( $95 \% \mathrm{Cl}$ : 2.8-4.3) (Figure 8)

Figure 8. MEAN NUMber of drinking occasions in the past 30 days among Current (Past 30 days) DRINKERS FOR BOTH SEXES, BY AGE AND AREA OF RESIDENCE

Current drinkers (past 30 days) were asked about the mean number of standard drinks consumed on a drinking occasion. Current drinkers consumed on average 3.5 drinks per drinking occasion for both sexes ( $95 \% \mathrm{Cl}: 3.2-3.9$ ), with men consuming 3.6 drinks ( $95 \% \mathrm{Cl}$ : 3.2-3.9). In 45-69 age group, men consumed almost three times more mean number of standard drinks per drinking occasion than women.

As shown in Figure 9, the mean number of standard drinks per drinking occasion was slightly higher among the rural population 3.6 drinks ( $95 \% \mathrm{Cl}$ : $3.1-4.1$ ) as opposed to 3.4 drinks ( $95 \%$ CI: 2.9-3.9) for urban residents.

Figure 9. Mean number of standard drinks consumed on a drinking occasion among current (PAST 30 DAYS) DRINKERS FOR BOTH SEXES, BY AGE AND AREA OF RESIDENCE

As shown in Table 17, $70.5 \%$ of all current drinkers ( $95 \% \mathrm{Cl}: 64.0-77.0$ ) had a low risk associated with alcohol consumption; $13.3 \%$ of men ( $95 \% \mathrm{Cl}$ : 8.6-17.9) and $11.4 \%$ of women ( $95 \% \mathrm{Cl}$ : 0.0-29.1) had a medium risk; and $16.3 \%$ of men ( $95 \% \mathrm{Cl}: 11.3-21.3$ ) and $15.3 \%$ of women ( $95 \% \mathrm{Cl}: 0.0-46.1$ ) had a high risk. The differences between the age groups were not significant in both sexes groups.

Table 17. Percentage of current (PASt 30 days) drinkers with different drinking levels, by sex

|  | n | \% high- <br> end | $95 \% \mathrm{Cl}$ | \% <br> intermediate | $95 \% \mathrm{Cl}$ | \% lower- <br> end | $95 \% \mathrm{Cl}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 292 | 16,3 | $11,3-21,3$ | 13,3 | $8,6-17,9$ | 70,4 | $63,8-77,1$ |
| Women | 14 | 15,3 | $0.0-46,1$ | 11,4 | $0.0-29,1$ | 73,4 | $40,6-100.0$ |
| Both sexes | 306 | 16,3 | $11,3-21,2$ | 13,2 | $8,6-17,8$ | 70,5 | $64.0-77.0$ |

Mean maximum number of standard drinks consumed on one occasion in the past 30 days among male respondents was 4.4 ( $95 \% \mathrm{Cl}$ : 3.9-4.8), among women it was - 1.4 ( $95 \% \mathrm{Cl}$ : $1.0-$ 1.7) (Table 18).

Table 18. Mean maximum number of standard drinks consumed on one occasion in the past 30 DAYS, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean maximum number | 95\% CI | n | $\begin{gathered} \text { Mean } \\ \text { maximum } \\ \text { number } \end{gathered}$ | 95\% CI | n | Mean maximum number | 95\% CI |
| 18-44 | 119 | 4.0 | 3.4-4.6 | 8 | 1.4 | 0.9-1.8 | 127 | 3.9 | 3.4-4.4 |
| 45-69 | 160 | 4.9 | 4.2-5.6 | 6 | 1.3 | 0.9-1.8 | 166 | 4.8 | 4.1-5.5 |
| 18-69 | 279 | 4.4 | 3.9-4.8 | 14 | 1.4 | 1.0-1.7 | 293 | 4.3 | 3.8-4.7 |

About $11 \%$ of men ( $95 \% \mathrm{CI}: 8.4-13.6$ ) and only $0.2 \%$ of women ( $95 \% \mathrm{CI}$ : $0.0-0.4$ ) reported having consumed six or more drinks ("heavy episodic drinking") at least once during the last 30 days among the survey population.

Mean number of times with six or more drinks during a single occasion in the past 30 days among current drinkers for both sexes was 1.3 ( $95 \% \mathrm{Cl}: 0.0-0.2$ )

Table 19 shows frequency of alcohol consumption in the past 7 days for both sexes of respondents. $24.9 \%$ ( $95 \% \mathrm{Cl}$ : 18.7-31.1) of respondents among current drinkers reported no consumed alcohol in the past 7 days.

Table 19. Frequency of alcohol consumption in the past 7 days, by sex

Mean number of standard drinks consumed on average per day in the past 7 days among current (past 30 days) drinkers was only 0.2 (95\% CI:0.1-0.3).

Percentage of male respondents that consumed unrecorded alcohol (homebrewed alcohol, alcohol brought over the border, not intended for drinking or other untaxed alcohol) during the past 7 days among current (past 30 days) drinkers was $5.3 \%$ ( $95 \% \mathrm{Cl}$ : 2.4-8.3).

Mean number of standard drinks of unrecorded alcohol consumed on average per day in the past 7 days for both sexes was only 0.1 ( $95 \% \mathrm{Cl}: 0-0.3$ )

Percentage of male respondents who never had a needfor a first drink in the morning to get going after a heavy drinking session during the past 12 months among past 12-month drinkers was 96.2\% (95\% CI: 94.2-98.1).
95.0\% (95\% CI: 93.7-96.3) of all respondents were never having any problems with family or partner due to someone else's drinking in the past 12 months.

## Diet

Fruit and vegetable consumption of the survey population was assessed using indicators of"frequency of fruit and vegetable consumption per week" and "average daily consumption "stratified by gender, age and locations of residency.

The mean number of days per week on which fruit and vegetables were consumed was 5.1 ( $95 \% \mathrm{CI}: 5.0-5.2$ ) and 5.9 ( $95 \% \mathrm{CI}$ : 5.8-6.0) (for fruit and vegetables respectively).

Women more frequent consumed fruits, 5.2 days per week ( $95 \% \mathrm{CI}: 5.0-5.3$ ) than men, 5.0 days per week ( $95 \% \mathrm{Cl}: 4.8-5.2$ ).

Men consumed vegetables on average 5.8 ( $95 \% \mathrm{CI}: 5.7-6.0$ ) days per week and women 5.9 (95\% CI:5.8-6.1) days per week.

Consumption of both fruit and vegetables was a little more frequent in older age group (Table 20 and Table 21).

Table 20. Mean number of days fruit consumed in a typical week, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean number of days | 95\% CI | n | Mean <br> number <br> of days | 95\% CI | n | Mean number of days | 95\% CI |
| 18-44 | 519 | 5.0 | 4.7-5.2 | 735 | 5.1 | 4.9-5.3 | 1254 | 5,0 | 4,9-5,2 |
| 45-69 | 603 | 5.0 | 4.9-5.2 | 920 | 5.2 | 5.0-5.4 | 1523 | 5,1 | 5.0-5,3 |
| 18-69 | 1122 | 5.0 | 4.8-5.2 | 1655 | 5.2 | 5.0-5.3 | 2777 | 5,1 | 5.0-5,2 |

Table 21. Mean number of days vegetables consumed in a typical week

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean number of days | 95\% CI | n | Mean number of days | 95\% CI | n | Mean number of days | 95\% CI |
| 18-44 | 515 | 5,7 | 5,5-5,9 | 730 | 5,9 | 5,7-6,1 | 1245 | 5,8 | 5,7-6.0 |
| 45-69 | 598 | 5,9 | 5,8-6,1 | 912 | 6,0 | 5,9-6,1 | 1510 | 6,0 | 5,9-6,1 |
| 18-69 | 1113 | 5,8 | 5,7-6.0 | 1642 | 5,9 | 5,8-6,1 | 2755 | 5,9 | 5,8-6.0 |

The frequency of fruit consumption was found to be higher among urban populations - 5.2 days per week $(95 \% \mathrm{Cl}$ of $5.0-5.3)$ than among rural populations - 5.0 days $(95 \% \mathrm{Cl}: 4.8-$ 5.2)(Figure10).

Figure 10. Mean number of days fruit consumed in a typical week by age, sex and area of RESIDENCE

Same, the urban population consumed vegetables more frequently - 6 days per week ( $95 \% \mathrm{CI}$ $5.8-6.1$ ) than those in rural areas -5.8 days per week ( $95 \% \mathrm{Cl} 5.6-6.0$ ) (Figure 11).

Figure 11. Mean number of days vegetable consumed in a typical week by age, sex and area of RESIDENCE

Women of the 45-69 age group and urban citizens consumed more fruits and vegetable than other groups of respondents.

The majority of respondents ( $43.6 \%, 95 \% \mathrm{Cl}: 40.0-47.2$ ) of both sexes consumed 1-2 servings of fruit and/orvegetables per day $43.7 \%$ ( $95 \% \mathrm{Cl}: 39.0-48.3$ ) of men and $43.5 \%$ ( $95 \% \mathrm{Cl}: 39,7-$ 47,3 ) of women. About $6.6 \%$ ( $95 \% \mathrm{Cl}: 5.0-8,1$ ) of all respondents reported not consuming fruit or vegetables at all $-7.5 \%$ ( $95 \% \mathrm{CI}$ : 5.2-9.8) of men and $5.6 \% ~(95 \% \mathrm{CI}: 4.1-7.2$ ) of women. But on the other hand, in groups who consumed 5 or more servings of fruit and/or vegetables per day men consumed more servings than women ( $25.6 \%$ vs. $22.7 \%$ respectively) (Table 22).

Differences between age groups (18-44 and 45-69) are almost not notable.

Table 22. Number of servings of fruit and/or vegetables on average per day, by sex

The number of servings of fruit and vegetables consumed per day was found more among the urban citizens ( 3.8 servings, $95 \% \mathrm{Cl}: 3.5-4.1$ ) than in rural population ( 3.2 servings, $95 \% \mathrm{Cl}$ : 3.0-3.5) (Figure 12).

Figure 12. Mean number of servings of fruit and/or vegetables on average per day, by age, sex AND AREA OF RESIDENCE

Percentage of those eating less than five servings of fruit and/or vegetables on average per day for all respondents was 75.9 (95\%CI:72.8-79.0) (Table 24).

Table 24. Less than five servings of fruit and/or vegetables on average per day, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |

| 45-69 | 604 | 74,9 | 70,5-79,3 | 920 | 75,3 | 71,4-79,3 | 1524 | 75,1 | 71,5-78,7 |
| 18-69 | 1124 | 74,4 | 70,5-78,3 | 1655 | 77,3 | 73,8-80,8 | 2779 | 75,9 | 72,8-79.0 |

The knowledge, attitude and behavior of Azerbaijani adults towards dietary salt consumptionwere assessed using structured questions. The survey found that percentage of all respondents who always or often add salt or salty sauce to their food before eating or as they
 men and 24.8\% (95\% CI: 21.7-28.0) for women.

As shown in Figure13, there were visible differences between age groups (18-44 and 45-69), sex groups and area of residence.

Figure 13. Add salt always or often before eating or when eating,by age, sex and area of RESIDENCE (\%)

Percentage of all respondents who always or often add salt to their food when cooking or preparing foods at home for both sexes was65.9\% ( $95 \% \mathrm{CI}$ : 61.2-70.6). There are slightly significant differences among ages, respondents from men group more often added salt to their food $67.9 \%$ ( $95 \% \mathrm{CI}$ : 62.6-73.2) than women population $64.2 \%$ ( $95 \% \mathrm{CI}$ : 59.1-69.3). Urban citizens a little often added salt to their food than rural citizens (Figure14).

Figure 14. Add salt always or often when cooking or preparing food at home,by age, sex and AREA OF RESIDENCE (\%)

Respondents were asked if they often consumed processed food high in salt. Prevalence among all surveyparticipants was $26.6 \%$ ( $95 \% \mathrm{Cl}$ : 23.7-29.6). The percentage of men (29.6\%, $95 \% \mathrm{Cl}$ : 25.6-33.5) who reported eating processed food high in salt was higher than that of women (23.8\%, 95\% CI: 20.5-27.1) (Table. 25).

Table 25. Always or often consume processed food high in salt, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 18-44 | 524 | 32,2 | 26,9-37,5 | 740 | 28,1 | 23,5-32,8 | 1264 | 30,2 | 26,2-34,1 |
| 45-69 | 610 | 24,8 | 20,5-29,1 | 924 | 16,9 | 13,9-19,8 | 1534 | 20,6 | 17,7-23,6 |
| 18-69 | 1134 | 29,6 | 25,6-33,5 | 1664 | 23,8 | 20,5-27,1 | 2798 | 26,6 | 23,7-29,6 |

The proportion of respondents eating such foods decreased with age and this difference was statistically significant. Also, the survey foundsuch significant difference between rural and urban residents, with higher prevalence for the latter ( $21.5 \%, 95 \% \mathrm{CI}: 17.0-26.0$ vs.30.9\%, $95 \% \mathrm{Cl}$ : 27.1-34.8) respectively.

Almost $21.9 \%$ of all respondents think that they consume too much or far too much salt. The percentageof men with this opinion was a little more than that of women. No significant differences among age groups was revealed (Table 26).

TABLE 26. THINK THEY CONSUME FAR TOO MUCH OR TOO MUCH SALT, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% Cl | n | \% | 95\% Cl | n | \% | 95\% Cl |
| 18-44 | 515 | 21,8 | 17,4-26,2 | 732 | 23,0 | 19,5-26,4 | 1247 | 22,4 | 19,5-25,3 |
| 45-69 | 603 | 23,3 | 19,3-27,2 | 918 | 19,1 | 15,9-22,3 | 1521 | 21,1 | 18,3-23,9 |
| 18-69 | 1118 | 22,3 | 19.0-25,7 | 1650 | 21,5 | 18,8-24,1 | 2768 | 21,9 | 19,6-24,2 |

The proportion of men who thought they consume too little or far too little is higher (13.5\%) than that of women (10.6\%).

The percentagesof all respondents who things to be using (by their opinion) "just the right amount"was 66.1\% (95\% CI:63.4-68.8).

The majority of respondents think that they are consuming too much salt which could cause serious health problems ( $73.1 \%$, $95 \% \mathrm{Cl}$ : 68.8-77.5). The prevalence of women ( $75.1 \%$, $95 \%$ $\mathrm{CI}: 70.6-79.6$ ) with this belief was higher than that of men ( $71.0 \%, 95 \% \mathrm{Cl}: 66.0-76.0$ ). Differences between age groups for both sexes (18-44 and 45-69) are notable ( $69.7 \%$ vs. 78.9\% respectively) (Table 27).

Table 27. Think consuming too much salt could cause serious health problem, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | N | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 18-44 | 525 | 67,6 | 61,8-73,3 | 740 | 71,8 | 66,4-77,1 | 1265 | 69,7 | 64,8-74,5 |
| 45-69 | 611 | 77,2 | 71,4-83.0 | 925 | 80,5 | 76.0-85.0 | 1536 | 78,9 | 74,3-83,5 |
| 18-69 | 1136 | 71,0 | 66.0-76.0 | 1665 | 75,1 | 70,6-79,6 | 2801 | 73,1 | 68,8-77,5 |

In spite of a high percentage of respondents were aware that salt can cause serious health problems, $18.7 \%$ of them considered lowering salt in diet to be not at all important.
$37.0 \%$ thought this was very important; and $44.3 \%$ thought it was somewhat important. The proportion of women who considered lowering salt in their diet to be very or somewhat important was higher (84.1\%) than that of men (78.4\%) (Table 28).

TABLE 28. Importance of lowering salt in diet, by sex

|  | n | \% Very important | 95\% CI | \% Somewhat important | 95\% CI | \% <br> Not at all important | 95\% CI |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1079 | 34,5 | 29,9-39,1 | 43,9 | 39,5-48,3 | 21,6 | 17,7-25,5 |
| Women | 1607 | 39,3 | 35,1-43,4 | 44,8 | 41.0-48,5 | 16,0 | 12,5-19,4 |
| Both sexes | 2686 | 37,0 | 33,1-40,8 | 44,3 | 40,9-47,8 | 18,7 | 15,5-21,9 |

Significant age difference was identified for the answers to this question. In total for both sexes, there are no differences among urban and rural residents in the answer to the question about lowering salt in dietto be very important, but there is difference among respond of sexes group. For example, among men group $35.7 \%$ of urban people think that it is very important, in contrary with $33 \%$ of rural residents, but women in rural believe in importance of low salt diet more than in urban - 40,4\% vs. $38.4 \%$ respectively.

Respondents were asked about what actions they took to control salt intake on a regular basis.
To control salt intake on a regular basis,less than half ( $35.8 \% 95 \% \mathrm{Cl}: 31.3-40.3$ ) of the study population limited consumption of processed foods.

About $16.1 \%$ of respondents of both sexes ( $95 \% \mathrm{CI}$ : 12.6-19.6) responded replacing salt with spices during cooking and almost $15.2 \% ~(95 \% \mathrm{CI}$ : $12.0-18.4$ ) of respondents said that they looked at thesalt or sodium content on food labels. $26.9 \%(95 \% \mathrm{CI}: 23.0-30.8)$ of the study population reported that they bought low-salt/sodium alternatives (Figure 15).

Figure 15. Percentage of respondents who take specific action on a regular basis to control SALT INTAKE, BY SEX (\%)

## Physical Activity

Physical activity of the survey population was assessed by evaluating the intensity and durationof activities undertaken during work, travel and recreation. According to the WHO physical activity recommendations for health, adults should do at least 150 minutes of moderate-intensity physical activity or 75 minutes of vigorous-intensity physical activity. Physical activity of respondents was assessed based on how the WHO physical activity recommendations for health were met.

The survey results showed that only one in 5 individuals in the study population (19.1\%,95\% CI: 15.9-22.3) did not meet WHO recommendations on physical activity for health. Physical activity of both sexes was $19.1 \%$, for men ( $95 \% \mathrm{Cl}$ : 15.3-22.9) and women ( $95 \% \mathrm{Cl}$ : 15.522.6).

As shown inFigure 16, differences between age groups (18-44 and 45-69) are slightly notable ( $18.9 \%$ vs. $19.5 \%$ respectively), but differences were more visible between the country's urban and rural populations, with a higher prevalence in urban areas.

Figure 16. Not meeting WHO recommendations on physical activity for health by sex, age and AREA OF RESIDENCE (\%)

Overall, $56.3 \%$ of the respondents were reported as having high level of physical activity. A little difference was detected between men ( $60.3 \%, 95 \% \mathrm{Cl}$ : $55.9-64.7$ ) and women ( $52.5 \%, 95 \% \mathrm{Cl}$ : 48.0-57.0).

A total of $20.8 \%$ of the respondents had moderate level and $22.9 \%$ had low level of physical activity. Women had more moderate and low level of activity than men ( $23.0 \%$ and $24.5 \%$ vs. $18.5 \%$ and $21.3 \%$ respectively). When examined by age groups, the level of physical activity tended to decline with age (Table 29).

TABLE 29. LEVEL OF TOTAL PHYSICAL ACTIVITY ACCORDING TO FORMER RECOMMENDATIONS, BY SEX

| Age | Both Sexes |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Group <br> (years) | n | \% Low | $95 \% \mathrm{Cl}$ | \% Moderate | $95 \% \mathrm{Cl}$ | $\%$ High | $95 \% \mathrm{Cl}$ |
| Men | 1121 | 21,3 | $17,3-25,2$ | 18,5 | $15,4-21,5$ | 60,3 | $55,9-64,7$ |
| Women | 1650 | 24,5 | $20,6-28,4$ | 23,0 | $20,1-25,9$ | 52,5 | $48.0-57.0$ |
| Both | $\mathbf{2 7 7 1}$ | $\mathbf{2 2 , 9}$ | $\mathbf{1 9 , 5 - 2 6 , 3}$ | $\mathbf{2 0 , 8}$ | $\mathbf{1 8 , 5 - 2 3 . 0}$ | $\mathbf{5 6 , 3}$ | $\mathbf{5 2 , 6 - 6 0 , 1}$ |
| sexes |  |  |  |  |  |  |  |

Total physical activity per day included work-related, transport-related and recreation-related activities.

Respondents aged 18-69 years carried out an average of 191.5 minutes of physical activity per day, with a statistically significant difference between men (215.2 minutes, 95\% CI: 192.7237.7) and women (168.9 minutes, 95\% CI: 149.9-187.8).

No significant difference was recorded between age groups of the same sex. The survey showed that individuals in rural areas were more exposed to physical activity, amongboth men
and women. The highest mean difference was discovered in men, with an average of 247.5 minutes (95\% CI: 216.0-279.0) among the rural population, compared with 188.0 minutes( $95 \%$ CI: 156.6-220.0) among men in urban areas (Figure 17).

Figure 17. MEAN minutes of total physical activity on average per day by sex, age and area of RESIDENCE

The physical activity levels are possible to measure with the mediantime spent performing physical activity.Median duration of all physical activity carried out dailyrecorded by all respondents was 128.6 ( $95 \% \mathrm{Cl}$ : 37.1-300.0) minutes; 145.7 ( $95 \% \mathrm{Cl}: 41.4-145.7$ ) minutes for men and 120 ( $95 \% \mathrm{CI}$ : 31.4-250.7) minutes forwomen. As shown in Table 30, the intensity of physical activity was inversely related to age among men group, but this relationship was not observed in women group. The median time spent carrying out physical activity was lower than themean time.

Table 30. Median minutes of total physical activity on average per day, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Median minutes | Inter- quartile range (P25- P75) | n | Median minutes | Inter- quartile range (P25-P75) | n | Median minutes | Inter- quartile range (P25- P75) |
| 18-44 | 516 | 153.6 | 51.4-347.1 | 734 | 120.0 | 30.0-240.0 | 1250 | 128.6 | 38.6-300.0 |
| 45-69 | 605 | 128.6 | 30.0-317.1 | 916 | 124.3 | 34.3-270.0 | 1521 | 124.3 | 34.3-300.0 |
| 18-69 | 1121 | 145.7 | 41.4-145.7 | 1650 | 120.0 | 31.4-250.7 | 2771 | 128.6 | 37.1-300.0 |

Figure 18 shows the distribution of the mean minutes of total physical activity by type of activity. In this figure we can notice the greatest differences between sexes in work-related and transport-related physical activities.

Figure 18. MEAN minutes spent in work-, TRANSPORT- AND RECREATION-RELATED PHYSICAL ACTIVITY ON AVERAGE PER DAY, BY SEX

As for sedentary activities on average per day men spent 203.6 minutes ( $95 \% \mathrm{CI}$ : 191.8-215.4), but women only 189 minutes ( $95 \%$ CI: 177.7-200.4).
$91.4 \%$ of women ( $95 \% \mathrm{Cl}$ : 89,3-93,5) wasnot engaging in vigorous physical activity (men $71.9 \%, 95 \% \mathrm{Cl}: 68.0-75,8)$ (Table 31).

Table 31. No vigorous physical activity, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% no vigorous activity | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | n | \% no activity | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | n | \% no vigorous activity activity | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ |
| 18-44 | 516 | 68,1 | $\begin{aligned} & \hline 62,7- \\ & 73,6 \end{aligned}$ | 734 | 91,9 | $\begin{gathered} \hline 89,4- \\ 94,4 \end{gathered}$ | 1250 | 80,0 | $\begin{gathered} \hline 76,9- \\ 83,2 \end{gathered}$ |
| 45-69 | 605 | 78,6 | $\begin{gathered} 74,3- \\ 83.0 \end{gathered}$ | 916 | 90,6 | $\begin{gathered} 87,5- \\ 93,6 \end{gathered}$ | 1521 | 84,9 | $\begin{gathered} 82.0- \\ 87,9 \end{gathered}$ |
| 18-69 | 1121 | 71,9 | $\begin{aligned} & 68.0- \\ & 75,8 \end{aligned}$ | 1650 | 91,4 | $\begin{gathered} 89,3- \\ 93,5 \end{gathered}$ | 2771 | 81,9 | $\begin{gathered} 79,5- \\ 84,3 \end{gathered}$ |

As shown on Figure 19, almost $50 \%$ of all respondents were not engaged to work activity $49,2 \%(95 \% \mathrm{Cl}: 45.0-53,4)$, and $76,5 \%$ ( $95 \% \mathrm{Cl}: 73,3-79,6$ ) - to leisure time. Differences between age groups (18-44 and 45-69) are slightly notable only in no recreation-related physical activity ( $72.9 \%$ vs. $82.5 \%$ respectively).

Figure 19.PERCENTAGE OF RESPONDENTS CLASSIFIED AS DOING NO WORK-, TRANSPORT- OR RECREATIONAL-RELATED PHYSICAL ACTIVITY, BY SEX (\%)

## History of raised blood pressure

The current health status of the study population related to highblood pressure was assessed by asking respondents about the history of blood pressure andtheir treatment history.

Among all study populations $33.1 \%$ ( $95 \% \mathrm{Cl}: 29,1-37,1$ ) reported that their blood pressure had never been measured; $45.2 \% ~(95 \% \mathrm{Cl}: 41,8-48,6)$ had undergone blood pressure measurement but had not been diagnosed with hypertension; 5.2\% ( $95 \% \mathrm{Cl}: 4,1-6,4$ ) had been diagnosed with high blood pressure more than a year before; and $16.4 \%(95 \% \mathrm{CI}: 14,6-$ $18,3)$ had been diagnosed with hypertension within the 12 months prior to the interview.

As the prevalence of high blood pressure is usually greater in elderly people, it follows that younger age groups answered more frequently that they were never checked or diagnosed with hypertension, while the older age groups more frequently answered that they were checked and diagnosed with blood pressure problems more often.

Some statistically significant differences emerged in terms of raised blood pressure history between the sexes. A total of $38.4 \%$ of men ( $95 \% \mathrm{Cl}$ : 33.8-43.0) had never had their blood pressure measured, compared with $28 \%$ of women ( $95 \% \mathrm{CI}: 23.8-32.2$ ).

The percentage of women diagnosed with high blood pressure within past 12 months washigher (18.9.6\%, $95 \% \mathrm{Cl}: 16.4-21.3$ ) than that of men (13.9\%, $95 \% \mathrm{CI}: 11.6-16.3$ ) (Table 32).

TABLE 32.BLOOD PRESSURE MEASUREMENT AND DIAGNOSIS, BY SEX

|  | n | \% Never measured | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% measured, not diagnosed | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% diagnosed, but not within past 12 months | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% diagnosed within past 12 months | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1136 | 38,4 | $\begin{aligned} & 33,8- \\ & 43.0 \end{aligned}$ | 42,5 | $\begin{aligned} & \hline 38,4- \\ & 46,6 \end{aligned}$ | 5,2 | $\begin{gathered} 3,5- \\ 6,9 \end{gathered}$ | 13,9 | $\begin{aligned} & 11,6- \\ & 16,3 \end{aligned}$ |
| Women | 1665 | 28,0 | $\begin{gathered} 23,8- \\ 32,2 \end{gathered}$ | 47,8 | $\begin{gathered} 43,9- \\ 51,7 \end{gathered}$ | 5,3 | $\begin{gathered} 4.0- \\ 6,7 \end{gathered}$ | 18,9 | $\begin{aligned} & 16,4- \\ & 21,3 \end{aligned}$ |
| Both sexes | 2801 | 33,1 | $\begin{gathered} 29,1- \\ 37,1 \end{gathered}$ | 45,2 | $\begin{gathered} 41,8- \\ 48,6 \end{gathered}$ | 5,2 | $\begin{gathered} 4,1- \\ 6,4 \end{gathered}$ | 16,4 | $\begin{aligned} & 14,6- \\ & 18,3 \end{aligned}$ |

Group of women of 45-69 years and group of respondents who living in rural areas measured blood pressure more than other groups of respondents (Figure 20).

Figure 20.Prevalence of never measured blood pressure, by sex, age and area of residence (\%)

Among those who had raised blood pressure or arterial hypertension, $47.9 \%$ ( $95 \% \mathrm{Cl}: 42,5-$ 53,3 ) of all respondents,42.1\% (95\% CI: 34,2-49,9) of men, and 52.3\% (95\% CI: 46,4-58,3) of women responded that they currently taking medication for raised blood pressure prescribed by doctor or health worker. The percentage of men who have not taken any medication for raised blood pressure was significantly higher compared to that of women.

When analyzed by locality, there was no significant difference detected in medication use for arterial hypertension between the urban and rural population. Only we can attend to one fact, that women living in urban area more taken medicaments than women of rural residence ( $48.9 \%$ vs. $46.8 \%$ ). The age group difference was statistically significant, with an increase in
the proportion of those taking medication from $29.1 \%$ ( $95 \% \mathrm{CI}$ : 20.1-38.1) among the age group 18-29 years to $57.5 \%$ ( $95 \% \mathrm{Cl}$ : $52.4-62.5$ ) in the age group 45-69 years (Table 33).

Table 33. Currently taking drugs (medication) for raised blood pressure prescribed by doctor OR HEALTH WORKER AMONG THOSE DIAGNOSED, BY SEX AND AGE

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% taking meds | 95\% CI | n | \% taking meds | 95\% CI | n | $\begin{gathered} \% \\ \text { taking } \\ \text { meds } \end{gathered}$ | 95\% CI |
| 18-44 | 58 | 22,7 | 10,1-35,3 | 98 | 35,0 | 23,2-46,9 | 156 | 29,1 | 20,1-38,1 |
| 45-69 | 219 | 53,8 | 45,2-62,4 | 422 | 60,0 | 54.0-66.0 | 641 | 57,5 | 52,4-62,5 |
| 18-69 | 277 | 42,1 | 34,2-49,9 | 520 | 52,3 | 46,4-58,3 | 797 | 47,9 | 42,5-53,3 |

A total of $13.6 \%$ ( $95 \% \mathrm{Cl}$ : 10.0-17.3) of respondents of both sexes among those previously diagnosed with raised blood pressure have sought advice from a traditional healer.

A total of $21.8 \%$ ( $95 \% \mathrm{Cl}$ : 17.6-25.9) of respondents of both sexes among those previously diagnosed with raised blood pressure have taken herbal or traditional remedy from a traditional healer.

## History of diabetes

History of diabetes and compliance to diabetes treatment was also analysed during the survey.
Among survey population, $71.8 \%$ ( $95 \% \mathrm{Cl}$ : 69.0-74,6) have never had their blood sugar measured, $23.5 \%$ ( $95 \% \mathrm{Cl}: 20,9-26,1$ ) were measured but were not diagnosed with raised blood sugar or diabetes, and $0.5 \%$ were diagnosed with raised blood sugar or diabetes but not within the past 12 months. Only $4.2 \%(95 \% \mathrm{Cl}: 3,5-5.0)$ respondents were diagnosed with raised blood sugar or diabetes within the past 12 months. Significantly more respondents aged $45-69$ years ( $9.8 \%, 95 \% \mathrm{Cl}: 8,2-11,5$ ) were diagnosed with raised blood sugar or diabetes than respondents aged 18-44 years ( $0.9 \%$, $95 \%$ CI: $0,4-1,4$ ). As seen in Table 34, the rate of respondents who answered that their blood sugar had never been measured was significantly higher among males than women ( $77.4 \%$ vs. $66.3 \%$ respectively) and this difference was detected in all age groups.

Table 34. Blood sugar measurement and diagnosis

| Sex | n | \% Never measured | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | $\begin{gathered} \text { \% measured, } \\ \text { not } \\ \text { diagnosed } \end{gathered}$ | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% diagnosed, but not within past 12 months | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% diagnosed within past 12 months | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1136 | 77,4 | $\begin{gathered} \hline 74,2- \\ 80,7 \end{gathered}$ | 19,1 | $\begin{aligned} & \hline 16.0- \\ & 22,2 \end{aligned}$ | 0,4 | $\begin{aligned} & \hline 0,1- \\ & 0,8 \end{aligned}$ | 3,1 | $\begin{aligned} & \hline 2,1- \\ & 4.0 \end{aligned}$ |
| Women | 1665 | 66,3 | $\begin{aligned} & 62,8- \\ & 69.9 \end{aligned}$ | 27,8 | $\begin{gathered} 24,5- \\ 31.0 \end{gathered}$ | 0,6 | $\begin{gathered} 0,2- \\ 1.0 \end{gathered}$ | 5,3 | $\begin{gathered} 4,2- \\ 6,4 \end{gathered}$ |
| Both sexes | 2801 | 71,8 | $\begin{aligned} & 69.0- \\ & 74,6 \end{aligned}$ | 23,5 | $\begin{aligned} & 20,9- \\ & 26,1 \end{aligned}$ | 0,5 | $\begin{gathered} 0,2- \\ 0,8 \\ \hline \end{gathered}$ | 4,2 | $\begin{gathered} 3,5- \\ 5.0 \end{gathered}$ |

As shown in Figure 21,there was a slight difference in quantity of all respondents who answered that their blood sugar had never been measured by place of residence with $74.3 \%$ (95\% CI: 70.3-78.3) in rural and 69.6\% in urban (95\% CI:65.7-73.5).

Figure 21.PREVALENCE of never measured blood sugar by sex, age and residence (\%)

During survey respondents previously diagnosed with raised blood sugar or diabetes were asked whether they had been prescribed any medication for diabetes by a health worker during the previous two weeks, or whether they were taking insulin for diabetes prescribed by a doctor or other health worker.

Some differences were identified between the sexes, with $72.9 \%$ of men ( $95 \% \mathrm{CI}$ : $59.7-$ 86.2 ) and $77.8 \%$ of women ( $95 \% \mathrm{Cl}$ : 69.7-85.9) taking any medication for diabetes prescribed by a doctoror a health worker (Table 35). More difference was found for those taking insulin, with $17.7 \%$ of men ( $95 \%$ CI: $7.2-28.3$ ) and $24.2 \%$ of women ( $95 \% \mathrm{CI}$ : 16.1-32.3) taking insulin recommended by a doctor or a health worker (Table 36).

TABLE 35. CURRENTLY TAKING MEDICATION PRESCRIBED FOR DIABETES AMONG THOSE PREVIOUSLY DIAGNOSED, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

TABLE 36. CURRENTLY TAKING INSULIN PRESCRIBED FOR DIABETES AMONG THOSE PREVIOUSLY DIAGNOSED, by AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% taking insulin | 95\% CI | n | \% taking insulin | 95\% CI | n | \% taking insulin | 95\% CI |
| 18-44 | 2 | 0,0 | 0.0-0.0 | 17 | 37,8 | $\begin{aligned} & \hline 10,1- \\ & 65,5 \end{aligned}$ | 19 | 32,9 | 7,9-58.0 |
| 45-69 | 64 | 18,7 | $\begin{array}{r} 7,7- \\ 29,6 \end{array}$ | 126 | 21,1 | $\begin{aligned} & 13,2- \\ & 29,1 \\ & \hline \end{aligned}$ | 190 | 20,2 | $\begin{aligned} & 13,6- \\ & 26,7 \\ & \hline \end{aligned}$ |
| 18-69 | 66 | 17,7 | $\begin{array}{r} 7,2- \\ 28,3 \\ \hline \end{array}$ | 143 | 24,2 | $\begin{aligned} & \hline 16,1- \\ & 32,3 \\ & \hline \end{aligned}$ | 209 | 21,9 | $\begin{aligned} & \hline 15,3- \\ & 28,5 \\ & \hline \end{aligned}$ |

In rural areas residents previously diagnosed with raised blood sugar or diabetes in compare with urban respondents more taken medicaments $79.7 \%(95 \% \mathrm{Cl}: 68.9-90.5)$ vs. 74.5 ( $95 \% \mathrm{Cl}$ : 65.1-83.9) respectively, and less insulin 15.3 ( $95 \% \mathrm{Cl}$ : $5.5-25.2$ ) vs. 24.6 ( $95 \% \mathrm{Cl}: 16.2-33.1$ ) respectively.

A total of $7.9 \%$ ( $95 \% \mathrm{CI}$ : 3.7-12.1) of respondents of both sexes among those previously diagnosed with diabetes have sought advice from a traditional healer.

A total of $17.2 \%$ ( $95 \% \mathrm{Cl}$ : 10.5-24.0) of respondents of both sexes among those previously diagnosed with diabetes have taken herbal or traditional treatment from a traditional healer.

## History of raised cholesterol

The results indicate that overall $89.9 \%$ ( $95 \% \mathrm{Cl}: 88,2-91,5$ ) of respondents of all ages answered that they never had their blood cholesterol measured within a healthcare facility, while $7.5 \%(95 \%$ CI: 6.0-9.0) had undergone a test for blood cholesterol level but had not been diagnosed with raised cholesterol. Only $0.9 \% 95 \%$ (CI: 0,6-1,2) of the study population had been diagnosed with a high level of cholesterol more than 12 months before the interview, and $1.7 \%$ ( $95 \%$ CI: $1,2-2,3$ ) within the past year.

Collating by age revealed a statistically significant difference between age groups in this indicator: older respondents diagnosed with a high level of blood cholesterol in comparison to younger respondents. There was no substantial difference between the sexes in terms of cholesterol measurement and diagnosis history (Table 37).

Table 37. Total cholesterolmeasurement and diagnosis

| Age Group (years) | Both sexes |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% Never measured | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | \% measured, not diagnosed | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | \% diagnosed, but not within past 12 months | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% diagnosed within past 12 months | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ |
| 18-44 | 1265 | 93,2 | $\begin{gathered} \hline 91,6- \\ 94,8 \end{gathered}$ | 6,0 | $\begin{gathered} \hline 4,4- \\ 7,6 \end{gathered}$ | 0,2 | $\begin{gathered} \hline 0.0- \\ 0,4 \end{gathered}$ | 0,6 | $\begin{gathered} \hline 0,2- \\ 1.0 \end{gathered}$ |
| 45-69 | 1536 | 84,2 | $\begin{aligned} & 81,5- \\ & 87.0 \end{aligned}$ | 10,1 | $\begin{aligned} & 8.0- \\ & 12,1 \end{aligned}$ | 2,0 | $\begin{aligned} & 1,2- \\ & 2,9 \end{aligned}$ | 3,7 | $\begin{array}{r} 2,5- \\ 4,9 \\ \hline \end{array}$ |
| 18-69 | 2801 | 89,9 | $\begin{aligned} & \hline 88,2- \\ & 91,5 \end{aligned}$ | 7,5 | $\begin{gathered} \hline 6.0- \\ 9.0 \\ \hline \end{gathered}$ | 0,9 | $\begin{aligned} & \hline \mathbf{0 , 6} \\ & 1,2 \end{aligned}$ | 1,7 | $\begin{aligned} & \hline \mathbf{1 , 2 -} \\ & \mathbf{2 , 3} \end{aligned}$ |

Respondents with ages 45-69 years and respondents living in urban area more measure total cholesterol level than other groups of respondents (Figure 22).

Figure 22. No total cholesterol measurement and diagnosis, by sex, by age and area of RESIDENCE (\%)

Among those diagnosed with a high level of total blood cholesterol, $26.8 \%$ ( $95 \% \mathrm{Cl}: 14.9-38.6$ ) had taken oral medication during the previous two weeks based on a prescription by a doctor or health worker. Of these respondents, $25.4 \%$ were men ( $95 \% \mathrm{CI}: 8.6-42.2$ ) and $27.8 \%$ were women ( $95 \% \mathrm{Cl}$ : 12.8-42.8). In urban area, men had taken oral medication twice more than women.

The overall of $10.1 \%$ ( $95 \% \mathrm{CI}: 3.7-16.5$ ) of respondents of both sexes among those previously diagnosed for raised cholesterol have sought advice from a traditional healer.

A total of $12.4 \%$ ( $95 \% \mathrm{Cl}$ : 5.3-19.5) of respondents of both sexes among those previously diagnosed with raised cholesterol have taken herbal or traditional treatment from a traditional healer.

## CVD history

The results indicate that overall6.4\% (95\% CI: 5.1-7.8) reported having ever had a heart attack or chest pain from heartdisease (angina) or stroke.

Clearly, that significant difference was observed between age groups: $3.0 \%$ ( $95 \% \mathrm{Cl}$ : 1.8-4.2) in the age group 18-44 years to $12.3 \%$ ( $95 \% \mathrm{Cl}$ : 9.9-14.7) in the age group 45-69 years.

No significant difference was detected between men (6.0\%, 95\% CI: 4.6-7.4) and women ( $6.9 \%, 95 \% \mathrm{Cl}: 5.0-8.7$ ). Also, no difference was observed in rural and urban residence for both sexes $-6.7 \%$ vs. $6.2 \%$ respectively.

The percentage of all respondents reported regularly taking aspirin was $4.6 \%$ ( $95 \% \mathrm{CI}$ : 3,7-5,5) and $1.7 \%$ ( $95 \% \mathrm{Cl}: 1.0-2,3$ ) of them also took statins to prevent or treat heart disease. The proportion of women that reported using aspirin for prevention or treatment of CVDs was almost the same that of men: $5.0 \%$ for males ( $95 \% \mathrm{Cl}: 3.8-6.3$ ) and $4.2 \%$ for females ( $95 \% \mathrm{Cl}$ : $3.2-5.2)$. Same trend in proportions was observed among both sex groups in using statins.

## Lifestyle advice

Figure 23 shows the distribution of responses about receiving different types of lifestyle advice from a doctor or a health worker during the past three years.

- $31.7 \%$ ( $95 \% \mathrm{Cl}: 27.8-35.6$ ) of respondents had been advised to stop smoking or not to start: 59.1\% among men (95\% CI: 52.2-65.9) and 13.5\% among women (95\% CI: 9.617.4).
- $56.7 \%$ ( $95 \%$ CI: 52.1-61.3) of respondents had been advised to reduce salt in their diet: $57.2 \%$ among men ( $95 \% \mathrm{CI}$ : 50.3-64.0) and $56.3 \%$ among women ( $95 \% \mathrm{CI}$ : 50.761.9).
- $59.6 \%$ ( $95 \% \mathrm{Cl}: 54.6-64.6$ ) of respondents had been advised to eat at least five servings of fruit and/or vegetable seach day: $58.9 \%$ among men ( $95 \% \mathrm{CI}$ :51.6-66.2) and $60.0 \%$ among women ( $95 \% \mathrm{Cl}$ : 54.2-65.9).
- $52.1 \% ~(95 \% \mathrm{CI}: 47.2-57.0)$ of respondents had been advised to reduce fat in their diet: $54.6 \%$ among men ( $95 \% \mathrm{Cl}: 47.4-61.9$ ) and $50.5 \%$ among women ( $95 \% \mathrm{CI}: 44.8-56.1$ ).
- $54.7 \%$ ( $95 \% \mathrm{Cl}: 50.3-59.1$ ) of respondents had been advised to start or to do more physical activity: $59.2 \%$ among men ( $95 \% \mathrm{Cl}$ : 53.1-65.4) and $51.6 \%$ among women (95\% CI: 46.2-57.1).
- $47.5 \%$ ( $95 \% \mathrm{Cl}: 42.9-52.0$ ) of respondents had been advised to maintain a healthy body weight or to lose weight: $56.6 \%$ among men ( $95 \% \mathrm{Cl}$ : 50.2-62.9) and $41.4 \%$ among women ( $95 \% \mathrm{Cl}$ : 36.0-46.7).
- $37.3 \%$ ( $95 \% \mathrm{Cl}: 32.9-41.8$ ) of respondents had been advised to reduce sugary beverages: $43.9 \%$ among men ( $95 \% \mathrm{CI}: 37.5-50.2$ ) and $33.0 \%$ among women ( $95 \% \mathrm{Cl}$ : 27.9-38.1).

Figure 23.Percentage of respondents, which advised by doctor or health worker, by sex (\%)

It is easy to see that useful advice on health by doctor or health worker was more given to men than to women. Actually, in all advices there was significant difference between age groups. Younger people receive advice less frequent.

## Cervical cancer screening

Next question was only for women respondents whether they had ever had a screening test for cervical cancer.

The percentage of all the women aged 18-69 years participating in the study who reported ever having undergone a screening test for cervical cancer was only $9.0 \%$ ( $95 \% \mathrm{Cl}$ : 6.7-11.4).

No significant difference was observed between both age groups (8.8 vs. 9.3 respectively). $11.3 \%$ ( $95 \% \mathrm{CI}$ : 8.2-14.3) women respondents aged 30-49 years had ever had a screening test for cervical cancer.

Women aged 18-69 in urban areas reported twice more frequently having ever undergone cervical cancer screening than the rural female population ( $11.6 \%$ vs. $5.6 \%$ ), in aged $30-49$ this proportion was more ( $15.1 \%$ vs. 6.1\%)(Figure24).
Figure 24. The percentage of female respondents 30-49 years who have ever had a screening test for cervical cancer,by age and area of residence (\%)

## Physical measurements

Hypertension as a risk factor for NCD was assessed by means of blood pressure measurement.

Mean systolic blood pressure (SBP) among all respondents, including those currently onmedication for raised blood pressure, was $125.9 \mathrm{mmHg}(95 \% \mathrm{Cl}: 124,0-127.0) ; 127.0 \mathrm{mmHg}$ for men ( $95 \% \mathrm{Cl}: 125.6-128.4$ ) and $124.8 \mathrm{mmHg}(95 \% \mathrm{Cl}: 123.4-126.2)$ for women.

Mean diastolic blood pressure (DBP) among them, including those currently on medication for raised blood pressure, was $81.2 \mathrm{mmHg}(95 \% \mathrm{Cl}: 80.4-82.0) ; 81.5 \mathrm{mmHg}(95 \% \mathrm{Cl}: 80.5-82.6)$ for men and 80.9 mmHg ( $95 \% \mathrm{Cl}$ : 80.1-81.8) for women.

Mean systolic and diastolic blood pressures were higher for older respondents aged 45-69 years than their younger counterparts aged 18-44. If the SBP in theage group 45-69 years was approximately $14 \%$ higher than in the age group 18-44 years, the difference in DBP between the same age groups was onlyabout 9\%. Examining rural-urban residence groups revealed similar proportions (Figures 25-26).

Figure 25. Mean SBP (mmHG), by sex, age and area of residence

Figure 26. Mean DBP (mmHg), by sex, age group and area of residence

All respondents have been divided into two groups, first - with an SBP $\geq 140$ and/or DBP $\geq 90$ mmHg , second - with an SBP of $\geq 160 \mathrm{mmHg}$ and/or a DBP of $\geq 100 \mathrm{mmHg}$.

In the first group the percentage of those with an SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$, excluding those on medication for raised blood pressure was 21.6 ( $95 \% \mathrm{CI}$ : 19.0-24.3);22.9\% ( $95 \% \mathrm{Cl}$ : 19.0-26.9) for men and $20.3 \%$ ( $95 \% \mathrm{Cl}: 17.7-22.9$ ) for women (Table 38).

TABLE 38. SBP $\geq 140$ AND/OR DBP $\geq 90 \mathrm{MMHG}$, EXCLUDING THOSE ON MEDICATION FOR RAISED BLOOD PRESSURE, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 18-44 | 500 | 16,2 | 11,4-21.0 | 678 | 10,0 | 7,3-12,6 | 1178 | 13,1 | 10,2-16.0 |
| 45-69 | 462 | 37,8 | 32,7-43.0 | 646 | 41,7 | 36,7-46,6 | 1108 | 39,8 | 35,7-43,8 |
| 18-69 | 962 | 22,9 | 19.0-26,9 | 1324 | 20,3 | 17,7-22,9 | 2286 | 21,6 | 19.0-24,3 |

The percentage of those with an SBP of SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or taking medication for raised blood pressure was $29.7 \%$ ( $95 \%$ CI: 27.2-32.1); $29.3 \%$ ( $95 \% \mathrm{CI}: 25.6-$ 33.0 ) for men and $30.1 \%(95 \% \mathrm{Cl}$ : 27.5-32.7) for women (Table 39).

TABLE 39. SBP $\geq 140$ AND/OR DBP $\geq 90$ mmHg OR CURRENTLY ON MEDICATION FOR RAISED BLOOD PRESSURE, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 18-44 | 510 | 17,7 | 13.0-22,5 | 707 | 12,9 | 10.0-15,8 | 1217 | 15,3 | 12,5-18,2 |

|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 18-44 | 510 | 5,3 | 3.0-7,5 | 707 | 6,0 | 4.0-8.0 | 1217 | 5,6 | 4.0-7,2 |
| 45-69 | 593 | 29,2 | 25,1-33,4 | 898 | 39,5 | 35,8-43,2 | 1491 | 34,6 | 31,7-37,6 |
| 18-69 | 1103 | 13,8 | 11,5-16,1 | 1605 | 19,0 | 16,9-21,1 | 2708 | 16,5 | 14,7-18,2 |

Clearly, that there was a statistically significant difference between ages groups.The percentage of respondents with controlled blood pressure was higher among the urban population ( $12.5 \%, 95 \% \mathrm{CI}: 9.0-16.0$ ) than among those in rural areas $(7.2 \%, 95 \% \mathrm{CI}: 4.4-$ 10.0). Also, theurban population comprised a higher proportion of individuals with hypertension and taking medication in contrary with respondents living in rural area.

Respondents answered the question: "During the past two weeks, have you been treated for raised blood pressure with drugs (medication) prescribed by a doctor or other health worker?" Of all respondents aged 18-69 years $10.1 \%(95 \% \mathrm{CI}: 7.8-12.3)$ did not have raised blood pressure because of taking medicaments, $24.5 \%$ ( $95 \% \mathrm{Cl}$ : 20.8-28.2) were taking medication but still had increased blood pressure (SBP $\geq 140 \mathrm{mmHg}$ and/or DBP $\geq 90 \mathrm{mmHg}$ ), and $65.4 \%$ ( $95 \% \mathrm{CI}$ : 60.9-70.0) were not taking medication but had increased blood pressure.

The proportion of women who were taking medication with SPB $<140 \mathrm{mmHg}$ and DBP $<90$ mmHg but that still had high blood pressure was twice that of men(Table 42).

Table 42. Respondents with treated and/or controlled raised blood pressure

| Sexes | n | $\begin{gathered} \text { \% On medication } \\ \text { and } \mathrm{SBP}<140 \text { and } \\ \mathrm{DBP}<90 \end{gathered}$ | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | $\begin{gathered} \text { \% On medication and } \\ \text { SBP } \geq 140 \\ \text { and/orDBP } \geq 90 \\ \hline \end{gathered}$ | $\begin{gathered} 95 \% \\ \mathrm{CI} \end{gathered}$ | $\begin{gathered} \text { \% Not on medication } \\ \text { and SBP } \geq 140 \\ \text { and/orDBP } \geq 90 \\ \hline \end{gathered}$ | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 401 | 6,4 | $\begin{aligned} & 3,9- \\ & 9.0 \end{aligned}$ | 21,6 | $\begin{aligned} & 16,4- \\ & 26,7 \end{aligned}$ | 72,0 | $\begin{aligned} & 66.0- \\ & 78.0 \end{aligned}$ |

The mean heart rate (beats per minute or bpm) of respondents was 77.2 beats per minute. As seen in Table 43, no significant difference in mean number of heart rate was detected between males and females and between both ages group.

Table 43. Mean heart rate (beats per minute), by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | mean | 95\% CI | n | mean | 95\% CI | n | mean | 95\% CI |
| 18-44 | 523 | 76,6 | 75,7-77,6 | 737 | 78,3 | 77,3-79,3 | 1260 | 77,5 | 76,7-78,3 |
| 45-69 | 610 | 75,9 | 74,9-76,8 | 919 | 77,4 | 76,5-78,2 | 1529 | 76,6 | 76.0-77,3 |
| 18-69 | 1133 | 76,4 | 75,6-77,1 | 1656 | 77,9 | 77,1-78,7 | 2789 | 77,2 | 76,5-77,8 |

In frame of STEP 2, anthropometric measurements such as height, weight, and waist and hip circumference were provided to calculate BMI and mean WHR. The prevalence of overweight and obesity inthe study population (excluding pregnant women) by age, sex and area of residence were calculated based on these measurements.

Male respondents were on average 172.3 cm tall ( $95 \% \mathrm{Cl}$ : 171.8-172.9) and weighted on average 77.1 kg ( $95 \% \mathrm{Cl}: 76.2-78.0$ ), and females were on average 161.1 cm tall ( $95 \% \mathrm{Cl}$ : 160.5-161.7) and weighted on average 69.8 kg ( $95 \% \mathrm{Cl}$ : 68.8-70.7). No significant difference in mean height and mean weight between rural and urban residents were detected (Figures 2728).

These measurements show that men were substantially taller and heavier than women.

Figure 27. Mean height (см), by sex, age and area of residence

Figure 28.Mean weight (KG), by Sex, age and area of residence

Mean BMI for all respondents was 26.0 ( $95 \% \mathrm{Cl}$ : 25.7-26.2). Mean BMI for women 26.4 (95\% CI: 26.0-26.9) was higher than that for men 25.5 ( $95 \% \mathrm{Cl}: 25.2-25.8$ ).

Among all respondents mean BMI was higher in the older age group as compared to the young age group 28.3 ( $95 \% \mathrm{CI}: 28.0-28,6$ ) and 24.6 ( $95 \% \mathrm{CI}$ : 24,3-24,9) respectively.

Table 44. Mean BMI (KG/M²), by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 18-44 | 517 | 24,5 | 24,1-24,8 | 695 | 24,7 | 24,1-25,2 | 1212 | 24,6 | 24,3-24,9 |
| 45-69 | 600 | 27,3 | 26,8-27,7 | 880 | 29,2 | 28,8-29,7 | 1480 | 28,3 | 28.0-28,6 |
| 18-69 | 1117 | 25,5 | 25,2-25,8 | 1575 | 26,4 | 26.0-26,9 | 2692 | 26,0 | 25,7-26,2 |

There was slightly marked difference in the mean BMI among males and females according to the place of residence. Mean BMI was higher in urban area than in rural for men 26.1 ( $95 \% \mathrm{CI}$ : $25.7-26.5$ ) vs. 25.8 ( $95 \% \mathrm{CI}: 25.5-26.2$ ) and women 27.1 ( $95 \% \mathrm{Cl}: 26.5-27.7$ ) vs. $26.8 \%$ (95\%CI:26.1-27.4) respectively (Figure 29).

Figure 29.MEAN BMI, by SeX, age and area of residence

All respondentswere grouped into four BMI categories: underweight ( $\mathrm{BMI}<18.5$ ), normal weight(BMI 18.5-24.9), overweight (BMI 25.0-29.9) and obese (BMI $\geq 30.0$ ). Of all respondents, $2.8 \%$ were underweight ( $\mathrm{BMI}<18.5$ ), $41.7 \%$ showed normal weight (BMI 18.524.9), $34.8 \%$ were overweight (BMI 25.0-29.9), and $20.6 \%$ were obese (BMI >30.0) (Table 45).

Table 45. BMI CLASSIFICATIONS, bY AGE AND SEX

|  | n | \% Under weight <18.5 | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | $\begin{gathered} \hline \text { \% Normal } \\ \text { weight } \\ 18.5-24.9 \\ \hline \end{gathered}$ | 95\% CI | $\begin{gathered} \text { \% Overweight } \\ \text { BMI } \\ 25.0-29.9 \\ \hline \end{gathered}$ | 95\% CI | $\begin{gathered} \hline \% \\ \text { Obese } \end{gathered}$ $\geq 30.0$ | 95\% CI |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1117 | 2.2 | $\begin{aligned} & 1.0- \\ & 3.4 \end{aligned}$ | 44.3 | $\begin{gathered} 40.5-1 \\ 48.1 \end{gathered}$ | 38.8 | $\begin{aligned} & \hline 34.9- \\ & 42.7 \end{aligned}$ | 14.7 | $\begin{aligned} & \hline 12.4- \\ & 17.1 \end{aligned}$ |
| Women | 1575 | 3.5 | $\begin{array}{r} 2.1- \\ 4.9 \end{array}$ | 39.1 | $\begin{array}{r} 35.9-1 \\ 42.2 \\ \hline \end{array}$ | 30.9 | $\begin{aligned} & 27.9-1 \\ & 339 \end{aligned}$ | 26.5 | $\begin{array}{r} 23.5- \\ 29.5 \end{array}$ |
| Both sexes | 2692 | 2.8 | $\begin{aligned} & 1.9- \\ & 3.7 \end{aligned}$ | 41.7 | $\begin{aligned} & 39.2- \\ & 44.2 \end{aligned}$ | 34.8 | $\begin{gathered} 32.4- \\ 37.3 \end{gathered}$ | 20.6 | $\begin{aligned} & 18.5- \\ & 22.7 \\ & \hline \end{aligned}$ |

Women respondents had a higher prevalence of $\mathrm{BMI} \geq 30.0$ ( $26.5 \%, 95 \% \mathrm{CI}$ : 23.5-29.5) than men respondents ( $14.7 \%, 95 \% \mathrm{Cl}: 12.4-17.1$ ).

The prevalence of BMI $\geq 25$ was higher in women than in men ( $57.4 \%$ vs $53.7 \%$ ) and in urban areas in comparison with rural settings ( $55.9 \%$ vs $54.9 \%$ ). The prevalence of obesity was higher in women than in men ( $26.5 \%$ vs. $14.7 \%$ ). The overall rate of respondents with BMI $\geq 25$ for both sexes was higher in the older age group than in younger (76.8\% vs. 42.7\%) (Figure 30).

Figure 30. Percentage of respondents (excluding pregnant women) with BMI $\mathbf{2} \mathbf{2 5}$, by age, sex and area of residence

Mean waist circumference among men was higher than among women excluding pregnant ones - 92.3 ( $95 \% \mathrm{Cl}$ : 91.1-93.5) versus 88.2 ( $95 \% \mathrm{CI}: 87.1-89.4$ ).

But mean hip circumference among men was less than among women excluding pregnant ones - 99.1 ( $95 \% \mathrm{Cl}$ : 98.0-100.2) versus 103.4 ( $95 \% \mathrm{CI}$ : 102.1-104.8).

## Biochemical Measurements

All respondents were asked if they currently receive any of the treatments for diabetes (prescribed by a doctor or other health worker), insulin or oral drug (medication) that they have taken in the last 2 weeks.

Mean fasting blood glucose level was found to be $4.6 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{CI}: 4.5-4.8)$ in the total studypopulation, including those currently taking medication for diabetes; $4.6 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}$ : $4.4-4.7$ ) in men and $4.7 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}: 4.6-4.8)$ in women.

Among all respondents' level of mean fasting blood glucose were lower in the younger group ( $4.4 \mathrm{mmol} / \mathrm{L}, 95 \% \mathrm{Cl}: 4.2-4.5$ ) as compared to the elder group ( $5.1 \mathrm{mmol} / \mathrm{L}, 95 \% \mathrm{Cl}: 4.9-5.2$ ). As seen on Figure 31. there was no significant difference in mean fasting blood glucose between rural and urban respondents.

Figure 31.Mean fasting blood glucose, by sex, age and area of residence

Impaired fasting glycaemia (IFG) was defined as plasma venous value: $\geq 6.1 \mathrm{mmol} / \mathrm{L}$ ( $110 \mathrm{mg} / \mathrm{dl}$ ) and $<7.0 \mathrm{mmol} / \mathrm{L}(126 \mathrm{mg} / \mathrm{dl})$. IFG was detected in5.0\% of all respondents. Someslight difference was observed between men $5.0 \% ~(95 \% \mathrm{Cl}: 3.5-6.5$ ) and women $4.9 \%$ ( $95 \% \mathrm{Cl}$ : 3.86.1). Levels of IFG for older age group were almost three times higher than younger age group (Table 46).
Table 46. Impaired Fasting Glycaemia, by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 18-44 | 19 | 3.6 | 1.8-5.5 | 17 | 2.3 | 1.1-3.6 | 36 | 3.0 | 1.8-4.1 |
| 45-69 | 47 | 7.5 | 4.8-10.2 | 81 | 9.1 | 6.9-11.2 | 128 | 8.3 | 6.6-10.0 |
| 18-69 | 66 | 5.0 | 3.5-6.5 | 98 | 4.9 | 3.8-6.1 | 164 | 5.0 | 4.0-5.9 |

Levels of IFG in urban area for all respondents were more than in rural area $6.1 \% ~(95 \% \mathrm{CI}$ : 4.77.5 ) vs $3.6 \%$ ( $95 \% \mathrm{Cl}: 4.7-7.5$ ) respectively.

Raised blood glucose was defined as plasma venous value: $\geq 7.0 \mathrm{mmol} / \mathrm{L}$ ( $126 \mathrm{mg} / \mathrm{dl}$ ). The overall prevalence of raised blood glucose was $6.5 \%$ ( $95 \% \mathrm{CI}: 5.4-7.6$ ), with $5.2 \%$ ( $95 \% \mathrm{Cl}$ : 3.8 6.5 ) in men and $7.9 \%$ ( $95 \%$ Cl:6.4-9.4) in women. Figures for raised blood glucose values in the age group 18-44 years were $3.6 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}$ : 2.4-4.8) and in the age group 44-69 years were $11.5 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}: 9.5-13.5)$ (Table 47).

TABLE 47. RAISED BLOOD GLUCOSE OR CURRENTLY ON MEDICATION FOR DIABETES, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% Cl | n | \% | 95\% Cl | n | \% | 95\% Cl |
| 18-44 | 497 | 2.3 | 0.9-3.8 | 695 | 4.9 | 3.3-6.5 | 1192 | 3.6 | 2.4-4.8 |
| 45-69 | 582 | 10.2 | 7.5-13.0 | 891 | 12.6 | 9.8-15.3 | 1473 | 11.5 | 9.5-13.5 |
| 18-69 | 1079 | 5.2 | 3.8-6.5 | 1586 | 7.9 | 6.4-9.4 | 2665 | 6.5 | 5.4-7.6 |

In urban area level of raised blood glucose was more than twice higher than in rural one - 8.7\% ( $95 \% \mathrm{CI}: 7-10.5$ ) vs. $4.0 \%$ ( $95 \% \mathrm{Cl}: 2.7-5.2$ ) respectively.

All respondents with diabetes and currently on medication had level of glucose $4.1 \mathrm{mmol} / \mathrm{L}$ ( $95 \% \mathrm{Cl}$ : 3.3-4.9). Level of glucose in blood of those respondents was twice higher in women than in men ( $5.4 \mathrm{mmol} / \mathrm{L}$ ( $95 \% \mathrm{Cl}: 4.2-6.6$ ) and $2.7 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}: 1.9-3.5$ ) respectively. Differences between age groups (18-44 and 45-69) are very significant ( $1.0 \%$ vs $9.2 \%$ respectively).Also, this proportion was more than twice higher in urban areas than that in rural ones - 5.3 ( $95 \% \mathrm{Cl}: 4.0-6.6$ ) vs. $2.6 \% ~(95 \% \mathrm{Cl}: 1.7-3.5$ ) respectively.

Blood cholesterol level was checkedamong all respondents, including participants receiving cholesterol-lowering medication.

Mean total blood cholesterol level was found to be $4.4 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}: 4.3-4.5)$ in the total studypopulation, 4.3 ( $95 \% \mathrm{Cl}: 4.2-4.4$ ) in men and $4.5 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}: 4.5-4.6)$ in women. These figures show that no significant difference in mean total blood cholesterol level was found between males and females.Mean total blood cholesterol level was slightly higher in the older age group (Table 48). No significant difference in level of mean total cholesterol was detected between rural and urban residents.

Table 48. Mean total cholesterol (mmol/L), by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 18-44 | 500 | 4.1 | 4.0-4.2 | 700 | 4.3 | 4.2-4.4 | 1200 | 4.2 | 4.1-4.3 |
| 45-69 | 588 | 4.6 | 4.5-4.7 | 895 | 4.9 | 4.8-5.0 | 1483 | 4.8 | 4.7-4.9 |
| 18-69 | 1088 | 4.3 | 4.2-4.4 | 1595 | 4.5 | 4.5-4.6 | 2683 | 4.4 | 4.3-4.5 |

A total of $26.9 \%$ of the study population had a blood cholesterol level of $\geq 5 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}$ : 24.4-29.4), and $6.0 \%$ ( $95 \% \mathrm{Cl}: 4.9-7.1$ ) had a blood cholesterol level of $\geq 6.2 \mathrm{mmol} / \mathrm{L}$. Substantial difference between sexes was found for percentage of total cholesterol levels: for a blood cholesterol level of $\geq 5 \mathrm{mmol} / \mathrm{L}$ : men-22.3\% ( $95 \% \mathrm{Cl}: 19.0-25.6$ ), women-31.3\% 95\% $\mathrm{Cl}: 28.1-34.5$ ); and for a blood cholesterol level of $\geq 6.2 \mathrm{mmol} / \mathrm{L}$ : men $-3.8 \%$ ( $95 \% \mathrm{Cl}: 2.7-5.0$ ), women - 8.1\% (95\% CI: 6.4-9.8) (Figure 32).

Figure 32. Percentage of respondents with raised total cholesterol, by sex (\%)

As shown in Figure 33, the percentage of women respondents that had raised total cholesterol of $\geq 5.0 \mathrm{mmol} /$ Land those with a blood cholesterol level of $\geq 6.2 \mathrm{mmol} / \mathrm{L}$ and that were currently taking medication for raised cholesterol more than among men respondents.

Figure 33. Percentage of respondents with raised total cholesterol and currently taking medication for raised cholesterol, by sex

The mean level of HDL cholesterol in bloodamong all respondentswas $1.1 \mathrm{mmol} / \mathrm{L}(95 \% \mathrm{Cl}$ : 1.1-1.1).

No significant difference in the mean level of HDL between males and females and among both age groups was detected. Among men, $51.7 \%(95 \% \mathrm{Cl}: 47.0-56.3)$ had an HDL level of less than $1.03 \mathrm{mmol} / \mathrm{L}$ (Table 49). Among women, $68.8 \%(95 \% \mathrm{Cl}: 65.4-72.3$ ) had an HDL level of
less than $1.29 \mathrm{mmol} / \mathrm{L}$ (Table 50). Differences between age groups (18-44 and $45-69$ ) are almost not notable.

Table 49.Percentage of respondents with HDL <1.03mmol/L, bY age

| Age Group | Men |  |  |
| :---: | :---: | :---: | :---: |
| (years) | n | $\%$ | $95 \% \mathrm{CI}$ |
| $18-44$ | 500 | 50.9 | $44.8-57.1$ |
| $45-69$ | 588 | 53.0 | $48.0-57.9$ |
| $\mathbf{1 8 - 6 9}$ | $\mathbf{1 0 8 8}$ | $\mathbf{5 1 . 7}$ | $\mathbf{4 7 . 0}-\mathbf{5 6 . 3}$ |

Table 50.Percentage of respondents with HDL <1.29mmol/L, by age

| Age Group | Women |  |  |
| :---: | :---: | :---: | :---: |
| (years) | n | $\%$ | $95 \% \mathrm{CI}$ |
| $18-44$ | 700 | 68.9 | $64.3-73.4$ |
| $45-69$ | 895 | 68.8 | $65.1-72.5$ |
| $\mathbf{1 8 - 6 9}$ | $\mathbf{1 5 9 5}$ | $\mathbf{6 8 . 8}$ | $\mathbf{6 5 . 4 - 7 2 . 3}$ |

Level of mean intake of salt in grams per day among all respondents was examined.

The WHO recommendation is less than 5 grams of salt or 2 grams of sodium per person per day.

Mean salt intake in the study population was 10.0 g/day ( $95 \% \mathrm{Cl}$ : 9,9-10.2). Differences between age groups (18-44 and 45-69) were almost not notable ( $9.8 \mathrm{~g} / \mathrm{day}$ vs $10.4 \mathrm{~g} / \mathrm{day}$ respectively). There was a significant gender difference in the mean salt intake: where 11.4 g/day ( $95 \% \mathrm{Cl}$ : 11.2-11.6) among men versus $8.6 \mathrm{~g} /$ day ( $95 \% \mathrm{Cl}: 8.5-8.8$ ) among women (Table 51).

Table 51. Mean salt intake (G/day), by age and sex

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 18-44 | 472 | 11.1 | 10.8-11.3 | 637 | 8.5 | 8.3-8.7 | 1109 | 9.8 | 9.6-10.0 |
| 45-69 | 554 | 12.1 | 11.9-12.3 | 824 | 8.8 | 8.7-9.0 | 1378 | 10.4 | 10.2-10.5 |
| 18-69 | 1026 | 11.4 | 11.2-11.6 | 1461 | 8.6 | 8.5-8.8 | 2487 | 10.0 | 9.9-10.2 |

As seen in Figure 34, respondents living in rural area take more salt per day than urban citizens.

Figure 34. Mean salt intake by sex, age and area of residence

## Cardiovascular disease risk (CVD)

Group of respondents with a 10 -year CVD risk of $\geq 30 \%$, and those with existing CVD was selectedfrom all respondents.

Instrument questions were combined from Step1, 2 and 3. Criteria for selecting group were as follows: a 10 -year CVD risk of $\geq 30 \%$ was defined according to age, sex, blood pressure, smoking status (current smokers or individuals who stopped smoking less than one year before the assessment), total cholesterol and diabetes (previously diagnosed or with a fasting plasma glucose concentration of $>7.0 \mathrm{mmol} / \mathrm{L}$ ).

Percentage of respondents with a 10 -year CVD risk $\geq 30 \%$ or with existing CVD was $12.6 \%$ ( $95 \% \mathrm{CI}$ : 10.4-14.8). The percentage of men was higher than women ( $13.3 \%$ vs. $12.0 \%$ respectively). But the levels ofthis indicator were differentamong newly created age groups, with a prevalence among people aged 55-69 years of more than two times higher than among those aged $40-54$ years ( $18.8 \%$ vs $8.6 \%$ respectively) (Table 52 ).

Table 52. Percentage of respondents with a 10-year CVD risk $\geq 30 \%$ OR WITh existing CVD, by AGE AND SEX

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% CI | n | \% | 95\% Cl | n | \% | 95\% CI |
| 40-54 | 323 | 8.6 | 5.1-12.0 | 511 | 8.7 | 5.8-11.6 | 834 | 8.6 | 6.3-11.0 |
| 55-69 | 342 | 20.8 | 15.5-26.1 | 498 | 17.0 | 13.1-21.0 | 840 | 18.8 | 15.3-22.3 |
| 40-69 | 665 | 13.3 | 10.3-16.3 | 1009 | 12.0 | 9.4-14.6 | 1674 | 12.6 | 10.4-14.8 |

As shown in Figure 35, respondentsliving in the urban area are a more risk of CVD than respondents from rural area of residence.

Figure 35. Percentage of respondents with a 10-Year CVD risk $\geq 30 \%$ OR WITh existing CVD, by SEX AND RESIDENCE

From group of respondents (40-69 years old, with a 10 -year CVD risk of $\geq 30 \%$, including those with existing CVD), more than half $-51.7 \% ~(95 \% \mathrm{CI}: 44.0-59.5)$ were receiving drug therapy andcounseling (including glycemic control) to prevent heart attacks and strokes.

There were the following types of counseling, receiving advice from doctor: stop smoking or not to start; reduce salt in diet; eat at least five servings of fruit and/or vegetables per day; reduce fat in diet; start or do more physical activity; maintain a healthy body weight or to lose weight.
Slight differences were observed between the age groups. Percentage of men in this group of respondents were more than women ( $57.9 \%$ vs. $45.6 \%$ respectively) (Table 53).

Table 53. Percentage of eligible persons receiving drug therapy and counseling to prevent HEART ATTACKS AND STROKES, BY AGE AND SEX

| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 40-54 | 27 | 52.2 | 29.9-74.5 | 53 | 37.6 | 22.5-52.8 | 80 | 44.5 | 31.1-57.9 |
| 55-69 | 71 | 61.6 | 48.8-74.4 | 93 | 51.8 | 39.9-63.8 | 164 | 56.9 | 47.8-66.1 |
| 40-69 | 98 | 57.9 | 46.1-69.6 | 146 | 45.6 | 36.1-55.1 | 244 | 51.7 | 44.0-59.5 |

Percentage of women receiving drug therapy and counseling to prevent heart attacks and strokes in urban area was almost twice more than women in rural residences (Figure 36).

Figure 36. Percentage of eligible persons receiving drug therapy and counseling to prevent HEART ATTACKS AND STROKES, BY AGE, SEX AND AREA OF RESIDENCE

## Summary of combined risk factors

For the purpose of exploring combined risk factors, responses were grouped into three categoriesaccording to the presence of the five major risk factors based on principal component analysis.
The first category was 'no risk factors'; the second 'one or two risk factors', and the third 'three to five risk factors'. The five major risk factors were:

1) current daily smokers
2) less than five servings of fruit and vegetables per day
3) low level of activity (<600 MET-minutes)
4) overweight or obese (BMI $\geq 25 \mathrm{~kg} / \mathrm{m} 2$ )
5) raised blood pressure (SBP $\geq 140 \mathrm{mmHg}$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medicationfor raised blood pressure)

The percentage of respondents with $0,1-2$ or $3-5$ risk factors by age group and sex are presented in Table 54. Only 5.8 \% ( $95 \%$ CI: 59.7-63.7 4.5-7.1) of all respondents did not have any risk factor for NCDs, whereas $61.7 \%$ ( $95 \% \mathrm{CI}$ : 59.7-63.7 59.2-64.2) had 1-2 risk factors and the remaining $32.5 \%(95 \% \mathrm{Cl}$ : 59.7-63.7 29.9-35.0) had a combination of 3-5 risk factors.

Percentage ofall respondents with 3-5 combined risk factors was higher in the older age group $49.9 \%$ ( $95 \% \mathrm{Cl}: 46.7-53.2$ ), than younger group $22 \%$ ( $95 \% \mathrm{CI}$ : 18.7-25.3), while proportion of those who havehad 1-2 risk factors was higher in the younger group $(70.1 \%, 95 \% \mathrm{CI}: 66.6-$ 73.5 ) than older group ( $47.8 \%, 95 \% \mathrm{CI}: 44.7-50.8$ ).

The proportion of men with combination of $3-5$ risk factors $40.0 \% ~(95 \% \mathrm{CI}: 36.0-44.0)$ was more than among women $24.9 \%$ ( $95 \% \mathrm{Cl}$ : 22.1-27.7). No significant difference in group with no risk factors between males and females was detected (Table 54).

Table 54. Summary of combined risk factors by sex

|  | n | \% with 0 risk factors | $\begin{gathered} 95 \% \\ \mathrm{Cl} \end{gathered}$ | \% with 1-2 risk factors | 95\% CI | \% with 3-5 risk factors | 95\% CI |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Men | 1069 | 5.4 | $\begin{gathered} \hline 3.6- \\ 7.3 \end{gathered}$ | 54.6 | $\begin{gathered} \hline 50.5- \\ 58.6 \end{gathered}$ | 40.0 | $\begin{aligned} & \hline 36.0- \\ & 44.0 \end{aligned}$ |
| Women | 1515 | 6.2 | $\begin{aligned} & 4.4- \\ & 8.0 \end{aligned}$ | 68.9 | $\begin{aligned} & 65.9- \\ & 71.9 \\ & \hline \end{aligned}$ | 24.9 | $\begin{aligned} & 22.1- \\ & 27.7 \\ & \hline \end{aligned}$ |
| Both sexes | 2584 | 5.8 | $\begin{aligned} & 4.5- \\ & 7.1 \end{aligned}$ | 61.7 | $\begin{aligned} & \hline 59.2- \\ & 64.2 \end{aligned}$ | 32.5 | $\begin{aligned} & \hline \text { 29.9- } \\ & 35.0 \end{aligned}$ |

As shown in Figure 37,the percentage of respondents with 3-5 risk factors are more among men 45-69 age and who areliving in urban area.

Figure 37.Percentage of 3-5 risk factors by sex, age and area of residence

## Mental Health

Of all respondents $1.5 \%$ had seriously considered attempting suicide in the preceding 12 months. The percentage of women who seriously considered attempting suicide in the last 12 months was significantly higher (1.1\%) than their male counterparts (0.4\%). As shown in Figure 38 , significant difference was observed in depends of the residence place as well.

Figure 38. Number of individuals who seriously considered attempting suicide in the PRECEDING12 MONTHS

Of these, only $25.0 \%$ ( 8 women) sought for professional help. $0.4 \%$ of study population had made a plan about suicide in the preceding 12 months. Significantly more women (12 individuals) had such a plan than men (only 1 individual). About $1.0 \%$ of the respondents had ever attempted suicide, of whom 30.0\% attempted in the past 12 months. About $32.0 \%$ of this category of respondents reported that they used poisoning with medication or drugs and 26.0\% reported to use razor, knife or other sharp instrument. About $0.7 \%$ of the respondents reported that they had ever had anyone in their close family attempting suicide and $0.4 \%$ actually reported that they had ever had someone in their close family who died from suicide.

## Violence and Injury

The percentage of drivers or passengers of a motor vehicle who did not always use a seat belt during the past 30 days was $53.0 \%$. This indicator was higher for women ( $67.1 \%$ ) compared to men (40.8\%). Collated by age groups, the percentage of $18-44$ year-old respondents who reported not always use helmet was a little higher compared to older age groups. Analyzed by locality, seat belt use was lower among the urban population compared to their rural counterparts (Figure 39).

Figure 39. Percentage of drivers or passengers who do not use a seatbelt, by age, sex and AREA OF RESIDENCE

The survey results also indicated that the majority ( $88.3 \%$ ) of respondents who use motorcycle and scooter did not wear a helmet ( $86.2 \%$ were men and $92.2 \%$ were women). Only $5.2 \%$ of respondents always used helmet while riding bike ( $6.7 \%$ were men and $3.3 \%$ were women). Collated by age groups, the percentage of 18-44 year-old respondents who reported not always use helmet was a little higher compared to older age groups.

The percentage of respondents who had been involved in a road traffic crash during the past 12 months was $2.8 \%$ and $30.0 \%$ of them had serious injuries requiring medical attention.

The percentage of respondents who drove or was a passenger in a motorized vehicle droved by driver after having two or more alcoholic drinks in the past 30 days was $1.8 \%$ ( 35 men and 5 women). Overall $4.4 \%$ reported that they had taken a ride on a motorized vehicle where the driver had consumed two or more alcoholic drinks before driving.

Those who've got injuries due to non-road traffic related accident that required medical attention were $4.4 \%$. A breakdown of the different types of injury causes revealed that the most common causes of serious injuries other than road traffic accidents that required medical attention were falls (58.8\%), cuts (16.2\%) and burns (10.2\%) (Figure 40).

Figure 40. Percentage of total respondents of the different types of injury causes

Among those injured in a non-road traffic related accident, 48.2\%got domestic injuries at home, $12.3 \%$ at their work placeor school, $16.5 \%$ outdoors on the street, and $10.2 \%$ at sports/athletic area.

About $2.5 \%$ of respondents were involved in a violent incident during the past 12 months resulting in an injury that required medical attention ( $3.5 \%$ were men and $1.6 \%$ were women). Majority of respondents who reported being frightened ( $5.8 \%$ of all study population), claimed that it was done by someone within the family ( $55.1 \%$ ), stranger ( $26.9 \%$ ) and friend or acquaintance (15.0\%).

The prevalence of those being physically abused during childhood by a parent or other adult in the household was $36.1 \%$ among the respondents.

A total $1.0 \%$ of respondents reported to have been sexually abused during childhood, about $0.9 \%$ of men and $1.1 \%$ of women respondents. About $0.4 \%$ of respondents reported being sexually abused during adulthood, $0.47 \%$ of men (4 individuals) and $0.49 \%$ of women ( 8 individuals).

## DISCUSSION

## Tobacco

The prevalence of tobacco use, both smoked and smokeless combined, was $24.0 \%$. One in every two men was a current smoker (48.8\%), whereas only $0.2 \%$ of women reported smoking at the time of the interview. There could be underreporting among women because of local customs. In comparison with the data obtained as a result of the STEPs study in Azerbaijan in 2011, the number of current smokers among men decreased slightly from $49.5 \%$ to $48.8 \%$. According to the Demographic and Health survey, conducted in 2006 in Azerbaijan Republic, smoking was common among men of age 15-59 with about half reporting that they were smokers (49.8\%). In 2015 data from State Statistical Committee of Azerbaijan Republic showed that $35.9 \%$ of men above 15 -year-old reportedof being smokers.

Regarding new STEPS survey, the percentage of current smokers among men was higher in the younger age group (49.3\%) as compared to the elder age group (47.8\%).The survey revealed a slight difference in the percentage of current male smokersby place of residence: in urban (49.2\%) and rural (48.3\%) areas. The survey showed that men started smoking from 18.7 years, with a little difference between male age groups:18-44 and 45-69 years(18.3 vs 19.4 respectively). Mean duration of smoking among daily men smokers was20.4 years. In current survey, mean duration for older respondents washigher than for younger group (33.9 vs. 13.1 respectively). $95.1 \%$ among daily smokers reported usageof manufactured cigarettes. The mean number of manufactured cigarettes smoked per day by daily smokers was 18.9 for all age groups.

Findings in DHS-2006 survey showed that among current smokers, over $90 \%$ reported that they smoked 10 or more cigarettes during the past 24 hours. The likelihood that a man smoked increased with age.Regarding 2011 STEPS survey men smoked on average 20 cigarettes. The mean age of starting tobacco smoking fordaily smokers was around 19 yearsoverall, the mean duration of smoking was 21.5 years.

Among currently smoking male respondents about $49.5 \%$ had tried to stop smoking during the last year. Nearly quarter of respondents (24.9\%) at home and more than one in five (18.3\%) of respondents at the workplace had been exposed to second-hand smoke during the 30 days preceding the survey.The greatest smoke exposure was found at workplaces for men (28.4\%) and at homes for women (23.3\%). In STEPS 2011 - the greatest exposure was found at public places for men ( $76.6 \%$ ) and at homes for women ( $41.2 \%$ ). These figures showed that smoke exposure significantly decreased from 2011 to 2017 years. During current survey, a low percentage of men also reported the use of Shisha and smokeless tobacco.

#### Abstract

Alcohol Current drinking was almost exclusively occurring among males: $27.6 \%$ of men and only $0.8 \%$ women reported current drinking alcohol.In this survey proportion of lifetime abstainer was $70.3 \%$, and it wasmore than reported in 2011 Steps survey - 65.7\%. Results in DHS 2006 showed that $40 \%$ of men age $15-59$ consumed at least one alcoholic beverage in the month prior to the interview. All these figures show a positive trend in decreasing level of alcohol consumption in Azerbaijan.

Regarding place of residence, men in rural areas are more likely to consume alcohol than men in urban areas ( $28.4 \%$ vs. $26.9 \%$ respectively). About $1.7 \%$ of men in the study population drank alcohol every day. These findings correspond to the results of STEPS-2011 survey, which reported daily alcohol consumption for $1.8 \%$ of men. But if we compare figures of male, who consumed alcohol less than once a month, in STEPS-2011 survey this figure was $40.4 \%$, whereasin the current survey this indicator increased - 46.8\%. Consumption of alcohol in the past 30 days among current drinkers was 3.9 occasions for men (in STEPS-2011 survey it was -3.0) and 1.8 occasions for women.

## Diet

The average number of days per week on which fruit and vegetables were consumed was 5.1 and 5.9 (for fruit and vegetables respectively). In contrary with results of previous STEPS-2011 survey, consumption of fruits and vegetables increased (in 2011 it was 4.0 and 5.0 respectively).The majority of respondents $-43.6 \%$ of both sexes consumed $1-2$ servings of fruits and/orvegetables per day. About $6.6 \%$ of all respondents reported not consuming fruit or vegetables at all $7.5 \%$ of men and $5.6 \%$ of women.

When examined by age groups, older respondents tended to have more fruits and/or vegetables in comparison to younger respondents. Vegetable consumption was relatively greater than fruit one. The quantity of intake was measured by servings, WHO recommends that an adult should consume five or more servings of fruit or vegetables a day. Almost $60 \%$ of respondents were advised by a doctor or health worker to eat more fruits and vegetables. However, only $24.1 \%$ of respondents had the recommended 5 or more servings of fruits and/or vegetables in a day. There is a big difference between the proportion of respondents who know about the benefits of eating fruits and vegetables, and who actually consumes them. Percentage of those eating less than five servings of fruit and/or vegetables on average per day for all respondents was 75.9 (in 2011 STEPS survey it was - 78.6).

Hereby, in spite of the fact, that Azerbaijan has good climate favorable for agriculture, and even exported some seasonal fruits and vegetables abroad, consumption of these products locally was low. Interesting finding was, that consumed of fruits and vegetables by urban population
exceed that by rural population. This can be explained with the fact that the population in the rural area is relatively poorer as compared to the urbanone.

## Dietary salt

Azerbaijan citizens consume 10 grams of salt per day, almost double the WHO recommendedlevel of $5 \mathrm{~g} /$ day, with significant gender difference mean salt intake, where $11.4 \mathrm{~g} /$ day of men versus $8.6 \mathrm{~g} /$ day of women. Almost every fourth person (25.7\%) reported adding salt while eating, with a higher prevalenceamong men (26.6\%) than among women (24.8\%) and, of these respondents, a slightly more prevalence was in rural areas (24.0\%) than urban ones (22.8\%).
$26.6 \%$ of the population often consumed processed food high in salt, with more men (29.6\%) reporting this behavior than women (23.8\%) and with a higher prevalence in urban areas (30.9\%) than the rural ones ( $21.5 \%$ ). Almost $73.1 \%$ of the study population agreed that high salt consumption has adverse health effects, but $24.9 \%$ of women and $29 \%$ of men thought differently.

## Physical activity

Sufficient physical activity, defined as more than two and half hours of moderate-intensity activity per week, is needed to reduce the risk of developing chronic non-communicable diseases. The survey results showed that about only one in 5 individuals in the study population did not meet WHO recommendations on physical activity for health.

There is no noticeable difference between the age groups and the male and female sex, but there is a visible difference between the place of residence, where urban population less meet WHO recommendation than rural citizens.

Overall, $56.3 \%$ of the respondents were reported as having high level of physical activity (men$60.3 \%$, women - 52.5\%).But in STEPS-2011 survey $44.1 \%$ of the respondents reported as having high level of physical activity with greater proportion of men having high physical activity than women ( $50.9 \%$ vs. $38.3 \%$ respectively). All respondents carried out an average of 191.5 minutes of physical activity per day, with a statistically significant difference between men 215.2 minutes and women 168.9 minutes. Results obtained during STEPS-2011 survey (men-212, women-139, both sexes - 172)werea bit worse comparing with current investigation. Thus, it can be concluded that the level of activity over the last 7 years has slightly increased.

Mean duration of all physical activity carried out daily reported by all respondents was 128.6 minutes; 145.7 minutes among men and 120 minutes among women. The median time spent carrying out physical activity was lower than the mean time.The intensity of physical activity was inversely related to age among men, but this relationship not observed in women.91.4\% of
women were not engaged in vigorous physical activity and men $-71.9 \%$. Based on these findings, there is need in adviceto adult population and women to be engaged more intensively in physical activity.

## Cervical cancer screening

Access to cervical cancer screening is necessary for the prevention and control of one of the leadingcancers in Azerbaijan.Only about one in ten (11.3\%) women aged 30-49 years have ever had a screening test for cervical cancer. Women aged 18-69 in urban areas reported twice more frequently having ever undergone cervical cancer screening than the rural female population.

## Overweight and obesity

In frame of STEP 2, anthropometric measurements such as height, weight, and waist and hip circumference were provided to calculate BMI and mean WHR. Height and weight measurements show that men were substantially taller and heavier than women. Same trend was observed among men and women during STEPS-2011 survey. Mean BMI for all respondents was 26.0. Mean BMI for women (26.4) was higher than that for men (25.5). Mean BMI was higher in the older age group. Of all respondents, $2.8 \%$ were underweight, $41.7 \%$ showed normal weight, $34.8 \%$ were overweight, and $20.6 \%$ were obese. However, the prevalence of obesity was substantially higher among women (26.5\%) than men (14.7\%)(more than 1.8 times) (in STEPS-2011 this proportion was - 1.7 times). Regarding the DHS -2011, the mean BMI for women age 15-49 was 25.2, and the percentage of obese women in same age group was $18.6 \%$. Thus, the results of both researches tend to overlap and prove that the overweight and obesity are essential problems for women in Azerbaijan and this highlights that the situation worsens in the absence of concrete policy actions to address these issues.

## Raised blood pressure (hypertension)

Mean SBP among the survey population was 125.9 mmHg , with the higher values found inmen ( 127.0 mmHg ). Mean DBP was 81.2 mmHg , with slightly differences between the sexes. Compared with data received from STEPS-2011 ( 137 mmHg and 84 mmHg respectively) these figures have decreased.

The mean heart rate of respondents was 77.2 beats per minute, women more than men 77.9 vs. 76.4 respectively). Same trend was observed in STEPS-2011 survey: mean heart rate of women had higher rate than that of men ( 84 vs .81 respectively).

Among all study populations $33.1 \%$ reported that their blood pressure had never been measured. Compared to the previous STEPS-2011 survey result for this indicator has increased almost twice (17\%).A total of $38.4 \%$ of men had never had their blood pressure
measured, compared with $28 \%$ of women. The percentage of women diagnosed with high blood pressure within past 12 months washigher (18.9\%) than that of men (13.9\%).

According of the both DHS surveys (2006 and 2011 year), prevalence of hypertension among women has decreased from 16.4\% in 2006 to 13\% in 2011.

The percentage of men who have not taken any medication for raised blood pressure was significantly higher compared to that of women.The survey revealed that the prevalence of hypertension (systolic blood pressure $>140 \mathrm{mmHg}$ and/or diastolic blood pressure $>90 \mathrm{mmHg}$, excluding those on medication for raised blood pressure) among the entire sample was $21.6 \%$.

This figure rose to $29.7 \%$ when those currently using medication were included. There was no significant difference in hypertension prevalence between men and women (29.3 \% vs.30.1\%). The percentage of respondents with controlled blood pressure was higher among the urban population (12.5\%), than among those in rural areas (7.2\%).

About $65.4 \%$ of respondents with increased blood pressure were not taking any medication, with the proportion of men (72.0\%) being higher than that of women (59.2\%). Percentage of respondents which currently taking medication for raised blood pressure prescribed by doctor or health worker among those diagnosed increased with age of respondents which reflected the natural history of hypertension (from 29.1\% among the age group 18-44 years to 57.5\% in the age group 45-69 years.)

The awareness of respondents about lifestyle modifications to address raised blood pressure was also not adequate. In particular, $47.5 \%$ of them received advice to lose weight, $52.1 \%$ of respondents had been advised to reduce fat in their diet, $54.7 \%$ of respondents had been advised to start or to do more physical activity and only $31.7 \%$ of respondents had been advised to stop smoking or not to start. These findings revealed that awareness raising efforts to modify lifestyle factors contributing to hypertension were generally insufficient.

## Raised blood glucose (diabetes mellitus)

Around $71.8 \%$ of respondents had never had their blood glucose measured. This figure has increased in compare with the data received during previous STEPS-2011 report where number of all respondents who answered that their blood sugar had never been measured was $62.3 \%$. The prevalence ofdiabetes diagnosed within the preceding 12 months was $4.2 \%$ (men $3.1 \%$, women $5.3 \%$ ) and $0.5 \%$ diagnosed, but not within past 12 months. Among thosewith diabetes, $21.9 \%$ were receiving insulin and $76.0 \%$ were taking oral drugs for diabetes. Some differences were identified between the sexes, with $72.9 \%$ of men and $77.8 \%$ of women taking any medication for diabetes. More difference was found for those taking insulin, with $17.7 \%$ of men and $24.2 \%$ of women. The prevalence of impaired fasting glycaemia (IFG) was 5.0\% (men
$5.0 \%$, women $4.9 \%$ ). Levels of IFG in urban area for all respondents was almost two times higher than in rural area.

The prevalence of diabetes mellitus, including those on medication, for all respondents was $6.5 \%$ (women significantly more than men - 7.9 vs. $5.2 \%$ respectively). Again, the proportion on urbanlevel was more than twice $-5.3 \%$ vs. $2.6 \%$. The prevalence of self-reported diabeteswas a little lower ( $4.7 \%$ ), than prevalence of raised blood glucose or currently on medication for diabetes (6.5\%) and these findings indicate to insufficient screening efforts todetect elevated blood glucose levels.

## Abnormal lipids

The prevalence of raised total cholesterol ( $\geq 5.0 \mathrm{mmol} / \mathrm{L}$ ) including those currently on medication was $26.9 \%$ (men $22.6 \%$, women $31.5 \%$ ).

## Cardiovascular disease (CVD) risk and history of cardiovascular diseases

The percentage of those aged 40-69 years with a 10-year cardiovascular risk of greater than $30 \%$ or with existing CVD was $12.6 \%$ being $13.3 \%$ for males and $12.0 \%$ for females. Within this group prevalence of people aged 55-69 years was more than two times higher than of those aged $40-54$ years ( $18.8 \%$ vs $8.6 \%$ respectively). From this group of respondents more than half - 51.7\% were receiving drug therapy and counseling (including glycemic control) to prevent heart attacks and strokes. Percentage of men in this group of respondents was more than women ( $57.9 \%$ vs 45.6 respectively). Percentage of all respondents who have ever had a heart attack or chest pain from heart disease (angina) or a stroke among all respondents was $6.4 \%$, and only $4.6 \%$ from them were taking aspirin and $1.7 \%$ were taking statins to prevent or treat heart disease.

## Combined risk factors

Only 5.8 \% of all respondents did not have any risk factor for NCDs, whereas $61.7 \%$ had 1-2 risk factors and the remaining $32.5 \%$ had a combination of $3-5$ risk factors. In STEPS-2011 survey prevalence of respondents whichdid not have any risk factor was $3.6 \%$, while percentage of respondents with combination of 3-5 risk factors was 43.9\%. It is obviously, that percentage of all respondents with 3-5 combined risk factors was higher in the older age group (49.9\%) than younger group (22\%).

The proportion of men with combination of 3-5 risk factors was more than that of women $40.0 \%$ versus $24.9 \%$ respectively.These results showed that the current high prevalence of NCDI risk factors among men have negative impacts on life expectancy and the quality of life of Azerbaijani men.

## Injuries

Regular use of seat belts is one of the important measures in mitigating the potential negative impacts of traffic accidents. Another dangerous cause of accidents is driver drunkenness. Despite the fact that according to the State Statistics Committee of Azerbaijan, the number of traffic accidents was decreasing from year to year, 760 people died in 2016 year as a result of traffic accidents and about 40 road accident cases were associated with drunk driving. According to data, obtained during current STEPs survey, more than half of drivers or passengers of a motor vehicle did not always use a seat belt during the past 30 days, with more women than men. Overall $4.4 \%$ respondents reported that they had taken a ride on a motorized vehicle where the driver had consumed two or more alcoholic drinks before driving.The lower rate of seatbelt use by women compared to that of men could be explained by significantly more men currently driving than women andcorrelatively, women were less informed about road traffic safety issues. Similar to the seat belt use,the rate of helmet use by motorcycle or bicycle riders was low.

## RECOMMENDATIONS

## Main findings of the second NCD risk factor survey in Azerbaijan:

Overall, tobacco use was relatively low, but very high among the men. Alcohol consumption was high among males. Other lifestyle factors such as overweight and obesity were noted to be generally high especially among females. The prevalence of both diagnosed and undiagnosed hypertension and diabetes mellitus were found to be high. Also, the prevalence of abnormal lipids was noted to be significant. Almost all of the survey respondents had at least one of these major risk factors.

Based on these findings, the following are the key recommendations:

- Based on the information generated by the survey, existing NCD policies and strategies should be adopted and tailored to effectively tackle the prevailing risk factors for NCDs in Azerbaijan, focusing on tobacco use, healthy diet, physical activity, prevention and control of hypertension and diabetes. For example, through actions such as increasing leisure time activity, raising rates of screening for blood pressure, glucose, cholesterol; addressing the dangers of second-hand smoke in the workplace and etc. There is an urgent need in effective implementation of these policies.
- It is necessary to ensure that the information obtained by this research reaches all stakeholders, especially policymakers, program managers and researchers in the design and implementation of interventions for the NCD prevention and control of the NCD risk factors.
- In order to promote interventions for prevention and control of NCDs, reduce the risks associated with them, a comprehensive approach is needed which will involve all sectors including Ministries of Health, Education, Youth and Sport, Trade, mass media,local NGOs, among others.
- Ascertaining integration of NCD prevention and control program into other primary health care services (reproductive health, school health, adolescence care and the elderly healthcare).
- Conducting national survey every three to five years to measure the trendsin risk factors over the time and to evaluate the NCD prevention and control programs with further expansion of risk factors and updating performing indicators.
- National health system should be equipped with adequate infrastructure, human resources, diagnostic tools, drugs and equipment to address NCD problems adequately at all levels.
- NCD screening/early detection services should be improved,integrated and strengthened at the primary health-care services. As an example, it is possible to implement a special tool such as the globally promoted WHO Package of Essential NCD (PEN) services in the primary health-care services to increase the coverage of NCD services. Facilities need to be equipped with basic diagnostic and management infrastructure. Essential NCD drugs could be made more available and accessible, especially for the poor. PHC health workers' competencies in counselingshould be improved. Training and upgrading the knowledge and skills of primary health-care providers on NCD risk factors and awareness of the population should be strengthened.
- Establish a multisectoral agency with large authorities and budget to oversee NCD prevention and control activities in Azerbaijanunder the direction of the Ministry of Health. Besides, there is the need for a comprehensive national surveillance and monitoring framework to measure progress towards the national goals and targets for prevention and control of NCDs. Monitoring and Evaluation system should comprise strategy assessment, detection and elimination of the problem, as well as provide the required information for the implementation of the appropriate action. Currently, however, there is no nationally representative data, or established systems for ongoing collection of data, to guide NCD-related policy and decision-making process. To develop and maintain such a system, research in public health should receive adequate funding, particularly on measures of cost-effectiveness and population-level interventions.
- Health workers should be encouraged to be role models for others and have the motivation to give healthy lifestyle advice to population because many respondents in this survey reported less than optimal exposure to advice on health and nutrition by health professionals at the level of health care.
- Several areas of knowledge about NCDs should be improved among population at individual level, including knowledge of body weight, blood pressure, etc. ("know your numbers").
- There is need to brainstorm ways to enhance health education programs, including targeted use of mass media and new communication technologies.
- There are revolutionary changes in medical information technologies, including telemedicine, artificial intelligence, portable mobile devices, self-care devices, which in the near future will change the ways of preventing and treating diseases, including NCD. The national health system need to be prepared for these changes and adequately address them in prepare policies, self-care programs for elderly patients to improve diseases prophylaxis, monitoring and control.
- Also, there is need inuse of the new innovation technologies in communication media to provide adequate health education at the level of health care services, including social media, video channels, medical applications for smartphones, etc.
- Routine and regular physical examinations including measurements of arterial pressure, blood sugar, cholesterol, and weights should be promoted.
- According to both STEPS surveys, the prevalence of tobacco use didn't actually change between 2011 and 2017 and remain stayingat high level. An attempt should be made to enforce the existing tobacco law and prevention of second-hand smoking. For example, it is necessary to develop strong monitoring mechanisms to control law execution and to identify new challenges, e.g. electronic cigarettes, shisha, indoor smoking, measures targeting smoking among youth.
- Comprehensive alcohol control strategies should be developed, focusing on the reduction of alcohol consumption among young citizens. Comparison of the last two surveys shows a positive trend in decreasing level of alcohol consumption in Azerbaijan. However, men in urban areas are more likely to consume alcohol than men in rural areas, and therefore there is the need to target this category of a population during healthy lifetime agitation.
- Interventions should be introduced to increase the consumption of fruit and vegetable among the community, which is low, in spite of good climate favorable for agriculture. The national recommendations for diet, and physical activity, if available, should be advocated through the media and developed further. NCD prevention and control strategy should also design gender-sensitive programs to improve consumption of fruits and or vegetables, especially among females and rural population.
- Quite a lot of people do not know about the harm of salty foods, and there is need to intensify agitation work in this direction. Also, there is need to work out the comprehensive policies and develop structural interventions in all sectors to improve access to healthy foods for all people and make mandatory food labeling, ban on advertising of unhealthy foods in mass media, taxes on unhealthy foods, reformulation of standards of manufactured foods in terms of salt, sugar and fats.
- Action is required at the national level to develop community-based physical activity programs which match the needs of the health. Interventions in all sectors are also needed to promote physical activity in different settings, develop accessible infrastructure for that. Health education programs are helpful to raise awareness on healthy lifestyles and should target all population sub-groups. The school settingsare particularly important to empower healthy choices of the young generation. Azerbaijan is closer to the east countries, where exist powerful sanative and healing system as yoga, meditation, naturopathy, which cover many aspects of healthy lifestyle, behaviors
and food habits, and theyshould be promoted and integrated into the primary health care system.
- Pap smear screening program should be introduced on the government level as routine services in the healthcare settings. Also, it is necessary to increase knowledge among women about the importance of conducting this test.
- Results of traffic accidents demonstrate that education on behavioral change in this area needs to be improved and the appropriate actions and measures are required to be enforced.

## ANNEX 1. WHO STEPS SURVEY 2017 FACT SHEET

## AZERBAIJAN STEPS Survey 2017

## Fact Sheet

The STEPS survey of noncommunicable disease (NCD) risk factors in Azerbaijan republic was carried out from May 2017 to March 2018. Azerbaijan republic implemented Step 1, Step 2 and Step 3. Socio demographic and behavioral information was collected in Step 1. Physical measurements such as height, weight and blood pressure were collected in Step 2. Biochemical measurements were collected to assess blood glucose and cholesterol levels in Step 3. The survey was a population-based survey of adults aged 18-69. A multi-stage cluster sample design was used to produce representative data for that age range in Azerbaijan republic. A total of 2801 adult participated in the survey. The overall response rate was $97 \%$.

| Results for adults aged 18-69 years (incl. 95\% CI) | Both Sexes | Males | Females |
| :---: | :---: | :---: | :---: |
| Step 1 Tobacco Use |  |  |  |
| Percentage who currently smoke tobacco | $\begin{gathered} 24.0 \% \\ (21.9-26.1) \end{gathered}$ | $\begin{gathered} 48.8 \% \\ (45.0-52.5) \end{gathered}$ | $\begin{gathered} 0.2 \% \\ (0-0.4) \end{gathered}$ |
| Percentage who currently smoke tobacco daily | $\begin{gathered} 23.2 \% \\ (21.2-25.3) \end{gathered}$ | $\begin{gathered} 47.2 \% \\ (43.5-50.9) \end{gathered}$ | $\begin{gathered} 0.2 \% \\ (0-0.4) \end{gathered}$ |
| Average age started smoking (years) | $\begin{gathered} 18.7 \\ (18.3-19.2) \end{gathered}$ | $\begin{gathered} 18.7 \\ (18.3-19.2) \end{gathered}$ | $\begin{gathered} 18.4 \\ (-) \end{gathered}$ |
| Percentage of daily smokers smoking manufactured cigarettes | $\begin{gathered} 95.1 \% \\ \text { (91.3-98.9) } \end{gathered}$ | $\begin{gathered} 95.1 \% \\ (91.3-98.9) \end{gathered}$ | $\begin{gathered} 100 \% \\ (100-100) \end{gathered}$ |
| Mean number of manufactured cigarettes smoked per day (by smokers of manufactured cigarettes) | $\begin{gathered} 18.9 \\ (17.5-20.2) \end{gathered}$ | $\begin{gathered} 18.9 \\ (17.6-20.2) \end{gathered}$ | $\begin{gathered} 12.7 \\ (-) \end{gathered}$ |
| Step 1 Alcohol Consumption |  |  |  |
| Percentage who are lifetime abstainers | $\begin{gathered} 70.3 \% \\ (67.5-73.2) \end{gathered}$ | $\begin{gathered} \hline 45.2 \% \\ (40.3-50.1) \end{gathered}$ | $\begin{gathered} 94.5 \% \\ (92.8-96.2) \end{gathered}$ |
| Percentage who are past 12-month abstainers | $\begin{gathered} 8.5 \% \\ (6.9-10.0) \end{gathered}$ | $\begin{gathered} 14.0 \% \\ (11.4-16.6) \end{gathered}$ | $\begin{gathered} \hline 3.2 \% \\ (2.0-4.3) \end{gathered}$ |
| Percentage who currently drink (drank alcohol in the past 30 days) | $\begin{gathered} \hline 13.9 \% \\ (12.1-15.8) \end{gathered}$ | $\begin{gathered} \hline 27.6 \% \\ (23.9-31.3) \end{gathered}$ | $\begin{gathered} \hline 0.8 \% \\ (0.4-1.3) \end{gathered}$ |
| Percentage who engage in heavy episodic drinking (6 or more drinks on any occasion in the past 30 days) | $\begin{gathered} 5.5 \% \\ (4.3-6.7) \end{gathered}$ | $\begin{gathered} \hline 11.0 \% \\ (8.4-13.6) \end{gathered}$ | $\begin{gathered} 0.2 \% \\ (0-0.4) \end{gathered}$ |
| Step 1 Diet |  |  |  |
| Mean number of days fruit consumed in a typical week | $\begin{gathered} 5.1 \\ (5.0-5.2) \end{gathered}$ | $\begin{gathered} 5.0 \\ (4.8-5.2) \end{gathered}$ | $\begin{gathered} 5.2 \\ (5.0-5.3) \end{gathered}$ |
| Mean number of servings of fruit consumed on average per day | $\begin{gathered} 1.6 \\ (1.5-1.7) \end{gathered}$ | $\begin{gathered} 1.7 \\ (1.6-1.8) \end{gathered}$ | $\begin{gathered} 1.6 \\ (1.5-1.7) \end{gathered}$ |
| Mean number of days vegetables consumed in a typical week | $\begin{gathered} 5.9 \\ (5.8-6.0) \end{gathered}$ | $\begin{gathered} 5.8 \\ (5.7-6.0) \end{gathered}$ | $\begin{gathered} 5.9 \\ (5.8-6.1) \end{gathered}$ |
| Mean number of servings of vegetables consumed on average per day | $\begin{gathered} 1.9 \\ (1.8-2.0) \end{gathered}$ | $\begin{gathered} 1.9 \\ (1.8-2.1) \end{gathered}$ | $\begin{gathered} 1.9 \\ (1.8-2.0) \end{gathered}$ |
| Percentage who ate less than 5 servings of fruit and/or vegetables on average per day | $\begin{gathered} 75.9 \% \\ (72.8-79.0) \end{gathered}$ | $\begin{gathered} 74.4 \% \\ (70.5-78.3) \end{gathered}$ | $\begin{gathered} 77.2 \% \\ (73.8-80.8) \end{gathered}$ |
| Percentage who always or often add salt or salty sauce to their food before eating or as they are eating | $\begin{gathered} 25.7 \% \\ (22.8-28.6) \end{gathered}$ | $\begin{gathered} \hline 26.6 \% \\ (22.6-30.5) \end{gathered}$ | $\begin{gathered} 24.9 \% \\ (21.7-28.0) \end{gathered}$ |
| Percentage who always or often eat processed foods high in salt | $\begin{gathered} 26.6 \% \\ (23.7-29.6) \end{gathered}$ | $\begin{gathered} 29.6 \% \\ (25.6-33.5) \end{gathered}$ | $\begin{gathered} 23.8 \% \\ (20.5-27.1) \end{gathered}$ |
| Step 1 Physical Activity |  |  |  |

| Percentage with insufficient physical activity (defined as $<150$ minutes of moderate-intensity activity per week, or equivalent)* | $\begin{gathered} \hline 19.1 \% \\ (15.9-22.3) \end{gathered}$ | $\begin{gathered} \text { 19.1\% } \\ \text { (15.3-22.9 } \end{gathered}$ | $\begin{gathered} 19.1 \% \\ (15.5-22.6) \end{gathered}$ |
| :---: | :---: | :---: | :---: |
| Median time spent in physical activity on average per day (minutes) (presented with inter-quartile range) | $\begin{gathered} 128.6 \\ (37.1-300.0) \end{gathered}$ | $\begin{gathered} 145.7 \\ (41.4-342.9) \end{gathered}$ | $\begin{gathered} 120.0 \\ (31.4-250.7) \end{gathered}$ |
| Percentage not engaging in vigorous activity | $\begin{gathered} \hline 81.9 \% \\ (79.5-84.3) \end{gathered}$ | $\begin{gathered} \hline 71.9 \% \\ (68.0-75.8) \end{gathered}$ | $\begin{gathered} \hline 91.4 \% \\ (89.3-93.5) \end{gathered}$ |
| Step 1 Cervical Cancer Screening |  |  |  |
| Percentage of women aged 30-49 years who have ever had a screening test for cervical cancer |  |  | $\begin{aligned} & \hline 11.3 \% \\ & (8.2-14.3) \end{aligned}$ |
| Step 2 Physical Measurements |  |  |  |
| Mean body mass index - BMI (kg/m²) | $\begin{gathered} 26.5 \\ (26.2-26.7) \end{gathered}$ | $\begin{gathered} 26.0 \\ (25.7-26.2) \end{gathered}$ | $\begin{gathered} 26.9 \\ (26.5-27.4) \end{gathered}$ |
| Percentage who are overweight ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ ) | $\begin{gathered} 55.5 \% \\ (52.9-58.0) \end{gathered}$ | $\begin{gathered} 53.5 \% \\ (49.8-57.2) \end{gathered}$ | $\begin{gathered} \hline 57.4 \% \\ (54.0-60.9) \end{gathered}$ |
| Percentage who are obese ( $\mathrm{BMI} \geq 30 \mathrm{~kg} / \mathrm{m}^{2}$ ) | $\begin{gathered} \hline 20.6 \% \\ (18.5-22.7) \end{gathered}$ | $\begin{gathered} \hline 14.7 \% \\ (12.4-17.1) \end{gathered}$ | $\begin{gathered} 26.5 \% \\ (23.6-29.5) \end{gathered}$ |
| Average waist circumference (cm) |  | $\begin{gathered} 92.3 \\ (91.1-93.5) \end{gathered}$ | $\begin{gathered} 88.2 \\ (87.1-89.4) \end{gathered}$ |
| Mean systolic blood pressure - SBP (mmHg), including those currently on medication for raised BP | $\begin{gathered} 126.1 \\ (125.0-127.2) \end{gathered}$ | $\begin{gathered} 127.3 \\ (125.9-128.7) \end{gathered}$ | $\begin{gathered} 125.0 \\ (123.6-126.4) \end{gathered}$ |
| Mean diastolic blood pressure - DBP (mmHg), including those currently on medication for raised BP | $\begin{gathered} 81.5 \\ (80.7-82.2) \end{gathered}$ | $\begin{gathered} 81.8 \\ (80.7-82.8) \end{gathered}$ | $\begin{gathered} \hline 81.2 \\ (80.3-82.0) \end{gathered}$ |
| Percentage with raised BP (SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medication for raised BP) | $\begin{gathered} 29.7 \% \\ (27.2-32.1) \end{gathered}$ | $\begin{gathered} 29.3 \% \\ (25.6-33.0) \end{gathered}$ | $\begin{gathered} 30.1 \% \\ (27.5-32.7) \end{gathered}$ |
| Percentage with raised BP (SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ ) who are not currently on medication for raised $B P$ | $\begin{gathered} \hline 21.6 \% \\ (19.0-24.3) \end{gathered}$ | $\begin{gathered} \hline 23.0 \% \\ (19.0-26.9) \end{gathered}$ | $\begin{gathered} \hline 20.3 \% \\ (17.7-22.9) \end{gathered}$ |
| Step 3 Biochemical Measurement |  |  |  |
| Mean fasting blood glucose, including those currently on medication for raised blood glucose [choose accordingly: $\mathrm{mmol} / \mathrm{L}$ or $\mathrm{mg} / \mathrm{dl}$ ] | $\begin{gathered} 5.1 \\ (5.0-5.2) \end{gathered}$ | $\begin{gathered} 5.0 \\ (4.9-5.2) \end{gathered}$ | $\begin{gathered} 5.2 \\ (5.0-5.3) \end{gathered}$ |
| Percentage with impaired fasting glycaemia as defined below plasma venous value $\geqslant 6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$ and $<7.0 \mathrm{mmol} / \mathrm{L}$ ( $126 \mathrm{mg} / \mathrm{dl}$ ) - capillary whole blood value $\geqslant 5.6 \mathrm{mmol} / \mathrm{L}(100 \mathrm{mg} / \mathrm{dl})$ and $<6.1 \mathrm{mmol} / \mathrm{L}$ ( $110 \mathrm{mg} / \mathrm{dl}$ ) | $\begin{gathered} 5.0 \% \\ (4.0-5.9) \end{gathered}$ | $\begin{gathered} 5.0 \% \\ (3.5-6.5) \end{gathered}$ | $\begin{gathered} 4.9 \% \\ (3.8-6.1) \end{gathered}$ |
| Percentage with raised fasting blood glucose as defined below or currently on medication for raised blood glucose <br> - plasma venous value $\geq 7.0 \mathrm{mmol} / \mathrm{L}(126 \mathrm{mg} / \mathrm{dl})$ <br> - capillary whole blood value $\geq 6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$ | $\begin{gathered} 4.1 \% \\ (3.3-4.9) \end{gathered}$ | $\begin{gathered} 2.7 \% \\ (1.9-3.6) \end{gathered}$ | $\begin{gathered} 5.4 \% \\ (4.2-6.6) \end{gathered}$ |
| Mean total blood cholesterol, including those currently on medication for raised cholesterol (mmol/L) | $\begin{gathered} 4.4 \\ (4.4-4.5) \end{gathered}$ | $\begin{gathered} 4.3 \\ (4.2-4.4) \end{gathered}$ | $\begin{gathered} 4.5 \\ (4.5-4.6) \end{gathered}$ |
| Percentage with raised total cholesterol $(\geq 5.0 \mathrm{mmol} / \mathrm{L}$ or $\geqslant 190 \mathrm{mg} / \mathrm{dl}$ or currently on medication for raised cholesterol) | $\begin{gathered} 27.1 \% \\ (24.6-29.6) \end{gathered}$ | $\begin{gathered} 22.6 \% \\ (19.3-25.8) \end{gathered}$ | $\begin{gathered} 31.5 \% \\ (28.3-34.7) \end{gathered}$ |
| Mean intake of salt per day (in grams) | $\begin{gathered} 10.0 \\ (9.9-10.2) \end{gathered}$ | $\begin{gathered} \hline 11.4 \\ (11.2-11.6) \end{gathered}$ | $\begin{gathered} 8.6 \\ (8.5-8.8) \end{gathered}$ |
| Cardiovascular disease (CVD) risk |  |  |  |
| Percentage aged 40-69 years with a 10 -year CVD risk $\geq 30 \%$, or with existing CVD** | $\begin{gathered} 12.6 \% \\ (10.4-14.8) \end{gathered}$ | $\begin{gathered} 13.3 \% \\ (10.3-16.3) \end{gathered}$ | $\begin{gathered} 12.0 \% \\ (9.4-14.6) \end{gathered}$ |

## Summary of combined risk factors

- current daily smokers
- less than 5 servings of fruits \& vegetables per day
- insufficient physical activity
- overweight (BMI $\geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ )
- raised $\mathrm{BP}(\mathrm{SBP} \geq 140$ and/or $\mathrm{DBP} \geq 90 \mathrm{mmHg}$ or currently on medication for raised BP$)$

| Percentage with none of the above risk factors | $5.8 \%$ <br> $(4.5-7.1)$ | $5.4 \%$ <br> $(3.6-7.3)$ | $6.2 \%$ <br> $(4.4-8.0)$ |
| :--- | :---: | :---: | :---: |
| Percentage with three or more of the above risk factors, | $22.0 \%$ | $31.0 \%$ | $12.5 \%$ |
| aged 18 to 44 years | $(18.7-25.3)$ | $(25.5-36.5)$ | $(9.5-15.5)$ |
| Percentage with three or more of the above risk factors, | $50 \%$ | $56.3 \%$ | $44.1 \%$ |
| aged 45 to 69 years | $(44.7-53.2)$ | $(51.8-60.8)$ | $(40.0-48.3)$ |
| Percentage with three or more of the above risk factors, | $32.5 \%$ | $40.0 \%$ | $24.9 \%$ |
| aged 18 to 69 years | $(29.9-35.0)$ | $(36.0-44.0)$ | $(22.1-27.7)$ |

* For complete definitions of insufficient physical activity, refer to theGPAQ Analysis Guide (http://www.who.int/chp/steps/GPAQ/en/index.html) or to the WHO Global recommendations on physical activity for health (http://www.who.int/dietphysicalactivity/factsheet recommendations/en/index.html)
** A 10-year CVD risk of $\geq 30 \%$ is defined according to age, sex, blood pressure, smoking status (current smokers OR those who quit smoking less than 1 year before the assessment), total cholesterol, and diabetes (previously diagnosed OR a fasting plasma glucose concentration $>7.0 \mathrm{mmol} / \mathrm{l}(126 \mathrm{mg} / \mathrm{dl})$.

## CORE: Diet

The next questions ask about the fruits and vegetables that you usually eat. I have a nutrition card here that shows you some examples of local fruits and vegetables. Each picture represents the size of a serving. As you answer these questions please think of a typical week in the last year.

| Question | Response | Code |
| :---: | :---: | :---: |
| In a typical week, on how many days do you eat fruit? (USF SHOWCARD) | Number of days $\llcorner\quad 1$ <br> Don't Know 77 D3 | D1 |
| How many servings of fruit do you eat on one of those days? (USE SHOWCARD) | Number of servings $\qquad$ Don't Know 77 | D2 |
| In a typical week, on how many days do you eat vegetables?(USE SHOWCARD) | Number of days $\square \quad$ If Zero days, go to <br> Don't Know 77 D5 | D3 |
| How many servings of vegetables do you eat on one of those days? (USE SHOWCARD) | Number of servings Don't know 77 | D4 |

## Dietary salt

With the next questions, we would like to learn more about salt in your diet. Dietary salt includes ordinary table salt, unrefined salt such as sea salt, iodized salt, salty stock cubes and powders, and salty sauces such as soy sauce or fish sauce (see showcard). The following questions are on adding salt to the food right before you eat it, on how food is prepared in your home, on eating processed foods that are high in salt such as [insert country specific examples], and questions on controlling your salt intake. Please answer the questions even if you consider yourself to eat a diet low in salt.

| How often do you add salt or a salty sauce such as soy <br> sauce to your food right before you eat it or as you are | Always  <br> Often 2 | D5 |
| :--- | :---: | :---: |

| eating it? <br> (SELECT ONLY ONE) | Sometimes <br> Rarely <br> Never <br> Don't know | $\begin{aligned} & 3 \\ & 4 \\ & 5 \\ & 77 \end{aligned}$ |  |
| :---: | :---: | :---: | :---: |
| How often is salt, salty seasoning or a salty sauce added in cooking or preparing foods in your household? | Always <br> Often <br> Sometimes <br> Rarely <br> Never <br> Don't know | $\begin{aligned} & \hline 1 \\ & 2 \\ & 3 \\ & 4 \\ & 5 \\ & 77 \end{aligned}$ | D6 |
| How often do you eat processed food high in salt? By processed food high in salt, I mean foods that have been altered from their natural state, such as packaged salty snacks, canned salty food including pickles and preserves, salty food prepared at a fast food restaurant, cheese, bacon and processed meat [add country specific examples]. <br> [INSERT EXAMPLES] | Always <br> Often <br> Sometimes <br> Rarely <br> Never <br> Don't know | $\begin{aligned} & \hline 1 \\ & 2 \\ & 3 \\ & 4 \\ & 5 \\ & 77 \end{aligned}$ | D7 |
| How much salt or salty sauce do you think you consume? | Far too much <br> Too much <br> Just the right amount <br> Too little <br> Far too little <br> Don't know | $\begin{aligned} & \hline 1 \\ & 2 \\ & 3 \\ & 4 \\ & 5 \\ & 77 \end{aligned}$ | D8 |

| EXPANDED: Diet |  |  |  |
| :---: | :---: | :---: | :---: |
| Question | Response |  | Code |
| How important to you is lowering the salt in your diet? | Very important <br> Somewhat important <br> Not at all important <br> Don't know | $\begin{aligned} & \hline 1 \\ & 2 \\ & 3 \\ & 77 \end{aligned}$ | D9 |
| Do you think that too much salt or salty sauce in your diet could cause a health problem? | Yes No Don't know | $\begin{aligned} & \hline 1 \\ & 2 \\ & 77 \end{aligned}$ | D10 |
| Do you do any of the following on a regular basis to control your salt intake? (RECORD FOR EACH) |  |  |  |
| Limit consumption of processed foods | $\begin{gathered} \text { Yes } \\ \text { No } \end{gathered}$ | $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | D11a |
| Look at the salt or sodium content on food labels | $\begin{gathered} \text { Yes } \\ \text { No } \end{gathered}$ | $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | D11b |
| Buy low salt/sodium alternatives | $\begin{aligned} & \text { Yes } \\ & \text { No } \end{aligned}$ | $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | D11c |
| Use spices other than salt when cooking | $\begin{aligned} & \text { Yes } \\ & \text { No } \end{aligned}$ | $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | D11d |
| Avoid eating foods prepared outside of a home | $\begin{gathered} \text { Yes } \\ \text { No } \end{gathered}$ | $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | D11e |
| Do other things specifically to control your salt intake | $\begin{gathered} \hline \text { Yes } \\ \text { No } \end{gathered}$ | $\begin{aligned} & 1 \text { If Yes, go to } \\ & 2 \end{aligned}$ | D11f |
| Other (please specify) | $1 \quad 1$ |  | D110the |

## CORE: Physical Activity

Next I am going to ask you about the time you spend doing different types of physical activity in a typical week. Please answer these questions even if you do not consider yourself to be a physically active person.

Think first about the time you spend doing work. Think of work as the things that you have to do such as paid or unpaid work, study/training, household chores, harvesting food/crops, fishing or hunting for food, seeking employment. [Insert other examples if needed]. In answering the following questions 'vigorous-intensity activities' are activities that require hard physical effort and cause large increases in breathing or heart rate, 'moderate-intensity activities' are activities that require moderate physical effort and cause small increases in breathing or heart rate.

| Question | Response | Code |
| :---: | :---: | :---: |
| Work |  |  |
| Does your work involve vigorous-intensity activity that causes large increases in breathing or heart rate like [carrying or liftingheavy loads, digging or construction work] for at least 10 minutes continuously? <br> INSERT FXAMPI ECI ISE SHOMCARDL | Yes 1 <br> No 2 If No, go to P 4 | P1 |
| In a typical week, on how many days do you do vigorousintensity activities as part of your work? | Number of days $\quad$ L | P2 |
| How much time do you spend doing vigorous-intensity activities at work on a typical day? | $\qquad$ . <br> Hours : minutes hrs mins | $\begin{gathered} \text { P3 } \\ (a-b) \end{gathered}$ |
| Does your work involve moderate-intensity activity, that causes small increases in breathing or heart rate such as brisk walking [or carrying light loads] for at least 10 minutes continuously? | Yes 1 <br> No 2 If No, go to P 7 | P4 |
| In a typical week, on how many days do you do moderate-intensity activities as part of your work? | Number of days Lـ | P5 |
| How much time do you spend doing moderate-intensity activities at work on a typical day? | Hours : minutes | $\begin{gathered} \text { P6 } \\ (\mathrm{a}-\mathrm{b}) \end{gathered}$ |
| Travel to and from places |  |  |
| The next questions exclude the physical activities at work that you have already mentioned. <br> Now I would like to ask you about the usual way you travel to and from places. For example to work, for shopping, to market, to place of worship.[Insert other examples if needed] |  |  |
| Do you walk or use a bicycle (pedal cycle) for at least 10 minutes continuously to get to and from places? | Yes 1 <br> No 2 If No, go to $P 10$ | P7 |
| In a typical week, on how many days do you walk or bicycle for at least 10 minutes continuously to get to and from places? | Number of days $\quad$ ـ | P8 |
| How much time do you spend walking or bicycling for travel on a typical day? | Hours : minutes $\underset{\text { hrs }}{\text { mins }}$ | $\begin{gathered} \text { P9 } \\ (\mathrm{a}-\mathrm{b}) \end{gathered}$ |
| CORE: Physical Activity, Continued |  |  |
| Question | Response | Code |
| Recreational activities |  |  |

| The next questions exclude the work and transport activities that you have already mentioned. <br> Now I would like to ask you about sports, fitness and recreational activities (leisure), [Insert relevant terms]. |  |  |  |
| :---: | :---: | :---: | :---: |
| Do you do any vigorous-intensity sports, fitess or recreational (leisure) activities that cause large increases in breathing or heart rate like [running or football] for at least 10 minutes continuously? <br> UINGERT EXAMDIESL UISE SHOWCARDI | Yes <br> No | 2 If No, go to P 13 | P10 |
| In a typical week, on how many days do you do vigorousintensity sports, fitness or recreational (leisure) activities? | Number of days | $\square$ | P11 |
| How much time do you spend doing vigorous-intensity sports, fitness or recreational activities on a typical day? | Hours : minutes |  | $\begin{aligned} & \text { P12 } \\ & (a-b) \end{aligned}$ |
| Do you do any moderate-intensity sports, fitness or recreational (leisure) activities that cause a small increase in breathing or heart rate such as brisk walking, [cycling, swimming, volleyball] for at least 10 minutes continuously? | Yes No | 2 If No, go to P16 | P13 |
| In a typical week, on how many days do you do moderate-intensity sports, fitness or recreational (leisure) activities? | Number of days | $\llcorner$ | P14 |
| How much time do you spend doing moderate-intensity sports, fitness or recreational (leisure) activities on a typical day? | Hours : minutes |  | $\begin{aligned} & \text { P15 } \\ & (\mathrm{a}-\mathrm{b}) \end{aligned}$ |

## EXPANDED: Physical Activity

## Sedentary behaviour

The following question is about sitting or reclining at work, at home, getting to and from places, or with friends including time spent sitting at a desk, sitting with friends, traveling in car, bus, train, reading, playing cards or watching television, but do not include time spent sleeping.
[INSERT EXAMPLES] (USE SHOWCARD)

| CORE: History of Raised Blood Pressure |  |  |  |
| :---: | :---: | :---: | :---: |

## CORE (for women only): Cervical Cancer Screening

The next question asks about cervical cancer prevention. Screening tests for cervical cancer prevention can be done in different ways, including Visual Inspection with Acetic Acid/vinegar (VIA), pap smear and Human Papillomavirus (HPV) test. VIA is an inspection of the surface of the uterine cervix after acetic acid (or vinegar) has been applied to it. For both pap smear and HPV test, a doctor or nurse uses a swab to wipe from inside your vagina, take a sample and send it to a laboratory. It is even possible that you were given the swab yourself and asked to swab the inside of your vagina. The laboratory checks for abnormal cell changes if a pap smear is done, and for the HP virus if an HPV test is done.

Have you ever had a screening test for cervical cancer, using any of these methods described above?

| Yes | 1 |
| ---: | ---: |
| No | 2 |
| Don't know | 77 |

## Step 2Physical Measurements

| CORE: Blood Pressure |  |  |
| :---: | :---: | :---: |
| Question | Response | Code |
| Interviewer ID | Lـ | M1 |
| Device ID for blood pressure | - | M2 |
| Cuff size used | Small 1 <br> Medium 2 <br> Large 3 | M3 |
| Reading 1 | Systolic ( mmHg) | M4a |
|  | Diastolic (mmHg) | M4b |
| Reading 2 | Systolic ( mmHg ) $\quad$ L $\quad 1 \quad 1$ | M5a |
|  | Diastolic (mmHg) | M5b |
| Reading 3 | Systolic ( mmHg ) $\quad$ - | M6a |
|  | Diastolic (mmHg) | M6b |
| During the past two weeks, have you been treated for raised blood pressure with drugs (medication) prescribed by a doctor or other health worker? | $\begin{array}{cc} \hline \text { Yes } & 1 \\ \text { No } & 2 \end{array}$ | M7 |
| CORE: Height and Weight |  |  |

| 18-69 | 313 | 0.2 | 0.1-0.3 | 14 | 0 |  | 327 | 0.2 | 0.1-0.3 |

Consumption Description: Percentage of respondents that consumed unrecorded alcohol of (homebrewed alcohol, alcohol brought over the border, not intended for unrecorded alcohol
drinking or other untaxed alcohol) during the past 7 days among current (past 30 days) drinkers.

Instrument questions:

- Have you consumed any alcohol within the past 30 days?
- During the past 7 days, did you consume any homebrewed alcohol, any alcohol brought over the border, not intended for drinking or other untaxed alcohol?

| Consumption of unrecorded alcohol |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Men |  |  | Women |  |  | Both Sexes |  |  |
| Age Group (years) | n | \% consuming unrecorded alcohol | 95\% CI | n | \% consuming unrecorded alcohol | 95\% Cl | n | \% consuming unrecorded alcohol | 95\% CI |

| 18-69 | 322 | 5,3 | 2,4-8,3 | 14 | 0 |  | 336 | 5,2 | 2,3-8.0 |

Standard
drinks of unrecorded alcohol per day in the past 7 days

Description:
Mean number of standard drinks of unrecorded alcohol consumed on average per day in the past 7 days among current (past 30 days) drinkers.

Instrument question:

- On average, how many standard drinks of the following did you consume during the past 7 days?

| Mean number of standard drinks of unrecorded alcohol consumed on average per day in the past 7 days among current drinkers |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Men |  |  | Women |  |  | Both Sexes |  |  |
| (years) | n | Mean number | 95\% CI | n | Mean number | 95\% CI | n | Mean number | 95\% CI |

Fruit and Description:
vegetable consumption per day

Percentage of respondents eating less than five servings of fruit and/or vegetables on average per day.

Instrument questions:
In a typical week, on how many days do you eat fruit?
How many servings of fruit do you eat on one of those days?
In a typical week, on how many days do you eat vegetables?
How many servings of vegetables do you eat on one of those days?

| Less than five servings of fruit and/or vegetables on average per day |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Physical Activity

Introduction
A population's physical activity (or inactivity) can be described in different ways. The two most common ways are
(1) to estimate a population's mean or median physical activity using a continuous indicator such as MET-minutes per week or time spent in physical activity, and
(2) to classify certain percentages of a population in specific groups by setting up cut-points for a specific amount of physical activity.

When analyzing GPAQ data, both continuous as well as categorical indicators are used.

Metabolic Equivalent (MET)

METs (Metabolic Equivalents) are commonly used to express the intensity of physical activities, and are also used for the analysis of GPAQ data.

Applying MET values to activity levels allows us to calculate total physical activity. MET is the ratio of a person's working metabolic rate relative to the resting metabolic rate. One MET is defined as the energy cost of sitting quietly, and is equivalent to a caloric consumption of $1 \mathrm{kcal} / \mathrm{kg} / \mathrm{hour}$. For the analysis of GPAQ data, existing guidelines have been adopted: It is estimated that, compared to sitting quietly, a person's caloric consumption is four times as high when being moderately active, and eight times as high when being vigorously active.

Therefore, for the calculation of a person's total physical activity using GPAQ data, the following MET values are used:

| Domain | MET value |
| :--- | :--- |
| Work | Moderate MET value $=4.0$ <br> Vigorous MET value $=8.0$ |
| Transport | Cycling and walking MET value $=4.0$ |
| Recreation | Moderate MET value $=4.0$ <br> Vigorous MET value $=8.0$ |

WHO global recommendations on physical activity for health

For the calculation of the categorical indicator on the recommended amount of physical activity for health, the total time spent in physical activity during a typical weekand the intensity of the physical activity are taken into account.

Throughout a week, including activity for work, during transport and leisure time, adults should do at least

- 150 minutes of moderate-intensity physical activity OR
- 75 minutes of vigorous-intensity physical activity OR
- An equivalent combination of moderate- and vigorous-intensity physical activity achieving at least 600 MET-minutes.
recommendations for comparison purposes

Former For comparison purposes, tables presenting cut-offs from former recommendations are also included in GPAQ data analysis.

The three levels of physical activity suggested for classifying populations were low, moderate, and high. The criteria for these levels are shown below.

## - High

A person reaching any of the following criteria is classified in this category: - Vigorous-intensity activity on at least 3 days achieving of at least 1,500 MET-minutes/week OR

- 7 or more days of any combination of walking, moderate- or vigorousintensity activities achieving a minimum of at least 3,000 MET-minutes per week.

## - Moderate

A person not meeting the criteria for the "high" category, but meeting any of the following criteria is classified in this category:

- 3 or more days of vigorous-intensity activity of at least 20 minutes per day OR
- 5 or more days of moderate-intensity activity or walking of at least 30 minutes per day OR
- 5 or more days of any combination of walking, moderate- or vigorousintensity activities achieving a minimum of at least 600 MET-minutes per week.
- Low

A person not meeting any of the above-mentioned criteria falls into the category of low-level physical activity.

Not meeting WHO recommendations on physical activity for health ("Insufficient physical activity")

Description:
Percentage of respondents not meeting WHO recommendations on physical activity for health (respondents doing less than 150 minutes of moderate-intensity physical activity per week, or equivalent).

Instrument questions
activity at work
travel to and from places

## Lifestyle Advice

## Lifestyle Description:

advice Percentage of respondents who received lifestyle advice from a doctor or health worker during the past three years among all respondents.

Instrument question:
During the past three years, has a doctor or other health worker advised you to do any of the following?

| Advised by doctor or health worker to quit using tobacco or don't start |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | \% advised | 95\% Cl | n | \% advised | 95\% Cl | n | \% advised | 95\% CI |
| 18-44 | 117 | 53,1 | 42,8-63,4 | 285 | 11,7 | 7,3-16,1 | 402 | 27,6 | 22,2-33.0 |

## Cervical Cancer Screening

Cervical Description:
cancer Percentage of female respondents who have ever had a screening test for screening cervical cancer among all female respondents.

Instrument question:
Have you ever had a screening test for cervical cancer, using any of these methods described above?

| Age Group <br> (years) | Women |  |  |
| :---: | :---: | :---: | :---: |
|  | n | \% ever <br> tested | $95 \% \mathrm{Cl}$ |
| $18-44$ | 712 | 8,8 | $6,1-11,6$ |
| $45-69$ | 868 | 9,3 | $6,5-12,1$ |
| $\mathbf{1 8 - 6 9}$ | $\mathbf{1 5 8 0}$ | $\mathbf{9 , 0}$ | $\mathbf{6 , 7 - 1 1 , 4}$ |

Cervical Description: Percentage of female respondents aged 30-49 yearswho have ever
cancer had a screening test for cervical cancer among all female respondents aged 30-
screening
among
women aged Instrument question:
30-49 years Have you ever had a screening test for cervical cancer, using any of these methods described above?

| Age Group <br> (years) | Women |  |  |
| :---: | :---: | :---: | :---: |
|  | n | \% ever <br> tested | $95 \% \mathrm{Cl}$ |
| $\mathbf{3 0 - 4 9}$ | $\mathbf{6 3 2}$ | $\mathbf{1 1 , 3}$ | $\mathbf{8 , 2 - 1 4 , 3}$ |

## Physical Measurements

## Blood pressure Description:

Mean blood pressure among all respondents, including those currently on medication for raised blood pressure.

## Instrument question:

Reading 1-3 systolic and diastolic blood pressure

| Mean systolic blood pressure ( mmHg ) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% Cl | n | Mean | 95\% Cl | n | Mean | 95\% Cl |
| 18-44 | 510 | 122,2 | 120,7-123,7 | 707 | 117,0 | 115,6-118,4 | 1217 | 119,6 | 118,5-120,7 |
| 45-69 | 593 | 135,7 | 133,6-137,8 | 898 | 137,1 | 134,9-139,3 | 1491 | 136,4 | 134,7-138,1 |
| 18-69 | 1103 | 127,0 | 125,6-128,4 | 1605 | 124,8 | 123,4-126,2 | 2708 | 125,9 | 124,8-127.0 |

| Mean diastolic blood pressure ( mmHg ) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% Cl |
| 18-44 | 510 | 79,2 | 77,9-80,5 | 707 | 77,7 | 76,6-78,7 | 1217 | 78,5 | 77,5-79,4 |
| 45-69 | 593 | 85,7 | 84,5-86,8 | 898 | 86,0 | 84,9-87,2 | 1491 | 85,9 | 85.0-86,8 |
| 18-69 | 1103 | 81,5 | 80,5-82,6 | 1605 | 80,9 | 80,1-81,8 | 2708 | 81,2 | 80,4-82.0 |

## Raised blood Description:

pressure Percentage of respondents with raised blood pressure.

## Instrument question:

Reading 1-3 systolic (SBP) and diastolic (DBP) blood pressure During the past two weeks, have you been treated for raised blood pressure with drugs (medication) prescribed by a doctor or other health worker?

| SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$, excluding those on medication for raised blood pressure |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% CI |
| 18-44 | 500 | 16,2 | 11,4-21.0 | 678 | 10,0 | 7,3-12,6 | 1178 | 13,1 | 10,2-16.0 |
| 45-69 | 462 | 37,8 | 32,7-43.0 | 646 | 41,7 | 36,7-46,6 | 1108 | 39,8 | 35,7-43,8 |
| 18-69 | 962 | 22,9 | 19.0-26,9 | 1324 | 20,3 | 17,7-22,9 | 2286 | 21,6 | 19.0-24,3 |

| SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medication for raised blood pressure |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 18-69 | 1103 | 13,8 | 11,5-16,1 | 1605 | 19,0 | 16,9-21,1 | 2708 | 16,5 | 14,7-18,2 |

## Treatment

 and control of raised blood pressureDescription:
Percentage of respondents with treated and/or controlled of raised blood pressure among those with raised blood pressure (SBP $\geq 140$ and/or DBP $\geq 90$ mmHg ) or currently on medication for raised blood pressure.

Instrument questions:
During the past two weeks, have you been treated for raised blood pressure with drugs (medication) prescribed by a doctor or other health worker?
Reading 1-3 systolic and diastolic blood pressure

| Respondents with treated and/or controlled raised blood pressure |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Waist Description:
circumference Mean waist circumference among all respondents (excluding pregnant women).

Instrument questions:
For women: Are you pregnant?
Waist circumference measurement

| Waist circumference (cm) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  |
|  | n | Mean | 95\% CI | n | Mean | 95\% CI |
| 18-44 | 523 | 88,4 | 87,2-89,6 | 706 | 82,7 | 81,3-84,1 |
| 45-69 | 606 | 99,3 | 97,7-100,8 | 898 | 96,8 | 95,6-98.0 |
| 18-69 | 1129 | 92,3 | 91,1-93,5 | 1604 | 88,2 | 87,1-89,4 |

Hip circumference

Description:
Mean hip circumference among all respondents (excluding pregnant women).

Instrument questions:
For women: Are you pregnant?
Hip circumference measurement

| Hip circumference (cm) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  |
|  | n | Mean | 95\% Cl | n | Mean | 95\% CI |
| 18-44 | 522 | 96,3 | 95.0-97,6 | 699 | 98,4 | 96,8-100.0 |
| 45-69 | 604 | 104,2 | 103.0-105,3 | 891 | 111,3 | 109,8-112,7 |
| 18-69 | 1126 | 99,1 | 98.0-100,2 | 1590 | 103,4 | 102,1-104,8 |

## Biochemical Measurements

| Mean Description: <br> fasting  <br> blood  <br> glucose  | mean fasting blood glucose results including those currently on medication for |
| :--- | :--- |
|  | diabetes (non-fasting recipients excluded). |
|  | Instrument questions: |
|  | During the last 12 hours have you had anything to eat or drink, other than |
|  | water? |
|  | Blood glucose measurement |

| Mean fasting blood glucose ( $\mathrm{mmol} / \mathrm{L}$ ) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% Cl | n | Mean | 95\% Cl | n | Mean | 95\% Cl |
| 18-44 | 497 | 4,3 | 4,1-4,5 | 695 | 4,5 | 4,3-4,6 | 1192 | 4,4 | 4,2-4,5 |
| 45-69 | 580 | 5,1 | 4,9-5,3 | 889 | 5,1 | 4,9-5,3 | 1469 | 5,1 | 4,9-5,2 |
| 18-69 | 1077 | 4,6 | 4,4-4,7 | 1584 | 4,7 | 4,6-4,8 | 2661 | 4,6 | 4,5-4,8 |

Raised blood glucose

Description: Categorization of respondents into blood glucose level categories and percentage of respondents currently on medication for raised blood glucose (non-fasting recipients excluded).

Instrument questions:
In the past two weeks, have you taken any drugs (medication) for diabetes prescribed by a doctor or other health worker?
Are you currently taking insulin for diabetes prescribed by a doctor or other health worker?
During the last 12 hours have you had anything to eat or drink, other than water?
Blood glucose measurement
Today, have you taken insulin or other drugs (medication) that have been prescribed by a doctor or other health worker?

| Impaired Fasting Glycaemia* |  |  |  |  |  |  |  |  |  |

* Impaired fasting glycaemia is defined as either
- plasma venous value: $\geq 6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$ and $<7.0 \mathrm{mmol} / \mathrm{L}(126 \mathrm{mg} / \mathrm{dl})$
- capillary whole blood value: $\geq 5.6 \mathrm{mmol} / \mathrm{L}(100 \mathrm{mg} / \mathrm{dl})$ and $<6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$
** Raised blood glucose is defined as either
- plasma venous value: $\geq 7.0 \mathrm{mmol} / \mathrm{L}(126 \mathrm{mg} / \mathrm{dl})$
- capillary whole blood value: $\geq 6.1 \mathrm{mmol} / \mathrm{L}(110 \mathrm{mg} / \mathrm{dl})$

Total
cholesterol

Description:
Mean total cholesterol among all respondents including those currently on medication for raised cholesterol.

Instrument question:
Total cholesterol measurement

| Mean total cholesterol (mmol/L) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | Mean | 95\% Cl | n | Mean | 95\% Cl | n | Mean | 95\% CI |
| 18-44 | 500 | 4.1 | 4.0-4.2 | 700 | 4.3 | 4.2-4.4 | 1200 | 4.2 | 4.1-4.3 |
| 45-69 | 588 | 4.6 | 4.5-4.7 | 895 | 4.9 | 4.8-5.0 | 1483 | 4.8 | 4.7-4.9 |

Introduction to intake of salt per day

Levels of sodium and creatinine in spot urine samples are used in STEPS to estimate population 24 hour salt intake, using the INTERSALT equation:

Estimated 24 hour sodium ( Na ) intake in mmol for males: $23.51+0.45 *$ spot Na concentration (mmol/L) -3.09*spot creatinine concentration (mmol/L)+4.16*BMI+0.22*Age

Estimated 24 hour sodium ( Na ) intake in mmol for females: $3.74+0.33^{*}$ spot Na concentration (mmol/L)-2.44* spot creatinine concentration (mmol/L)+2.42* BMI +2.34* Age -0.03* Age ^2

The 24 hour sodium values in mol are divided by 17.1 in order to get grams of salt.

## WHO The WHO recommendation is less than 5 grams of salt or 2 grams of sodium per person per day.

Intake of salt Description:
per day Mean intake of salt in grams per day among all respondents
Instrument question:
Are you pregnant?
Had you been fasting prior to urine collection?
Urinary sodium measurement
Urinary creatinine measurement

| Mean salt intake (g/day) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group | Men |  |  | Women |  |  | Both Sexes |  |  |
| (years) | n | Mean | 95\% CI | n | Mean | 95\% CI | n | Mean | 95\% Cl |
| 18-44 | 472 | 11.1 | 10.8-11.3 | 637 | 8.5 | 8.3-8.7 | 1109 | 9.8 | 9.6-10.0 |
| 45-69 | 554 | 12.1 | 11.9-12.3 | 824 | 8.8 | 8.7-9.0 | 1378 | 10.4 | 10.2-10.5 |
| 18-69 | 1026 | 11.4 | 11.2-11.6 | 1461 | 8.6 | 8.5-8.8 | 2487 | 10.0 | 9.9-10.2 |

## Cardiovascular Disease (CVD) Risk

CVD risk of Description:
$\geq 30 \%$ or Percentage of respondents aged 40-69 years with a 10-year cardiovascular existing CVD disease (CVD) risk* $\geq 30 \%$ or with existing CVD

Instrument questions: combined from Step 1, 2 and 3

- Gender, age
- Current and former smoking
- History ofdiabetes, CVD
- Systolic blood pressure measurements
- Fasting status, glucose and total cholesterol measurements.

| Percentage of respondents with a 10-year CVD risk $\geq 30 \%$ or with existing CVD |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | \% | 95\% CI | n | \% | 95\% Cl | n | \% | 95\% Cl |
| 40-54 | 323 | 8.6 | 5.1-12.0 | 511 | 8.7 | 5.8-11.6 | 834 | 8.6 | 6.3-11.0 |
| 55-69 | 342 | 20.8 | 15.5-26.1 | 498 | 17.0 | 13.1-21.0 | 840 | 18.8 | 15.3-22.3 |
| 40-69 | 665 | 13.3 | 10.3-16.3 | 1009 | 12.0 | 9.4-14.6 | 1674 | 12.6 | 10.4-14.8 |

* A 10-year CVD risk of $\geq 30 \%$ is defined according to age, sex, blood pressure, smoking status (current smokers OR those who quit smoking less than 1 year before the assessment), total cholesterol, and diabetes (previously diagnosed OR a fasting plasma glucose concentration $>7.0 \mathrm{mmol} / \mathrm{l}(126 \mathrm{mg} / \mathrm{dl})$ ).

```
Drug Description:
therapy and
counseling
for those
with CVD
risk \geq30% or
existing CVD
Description:
Percentage of eligible persons (defined as aged 40-69 years with a 10-year cardiovascular disease (CVD) risk* \(\geq 30 \%\), including those with existing CVD) receiving drug therapy and counseling**(including glycaemic control) to prevent heart attacks and strokes.
Instrument questions: combined from Step 1, 2 and 3
```

- Gender, age
- Current and former smoking
- History of diabetes, CVD
- Lifestyle advice
- Systolic blood pressure measurements
- Fasting status, glucose and total cholesterol measurements.

| Percentage of eligible persons receiving drug therapy and counseling to prevent heart attacks and strokes |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group (years) | Men |  |  | Women |  |  | Both Sexes |  |  |
|  | n | \% | 95\% CI | n | \% | 95\% CI | n | \% | 95\% Cl |
| 40-54 | 27 | 52.2 | 29.9-74.5 | 53 | 37.6 | 22.5-52.8 | 80 | 44.5 | 31.1-57.9 |
| 55-69 | 71 | 61.6 | 48.8-74.4 | 93 | 51.8 | 39.9-63.8 | 164 | 56.9 | 47.8-66.1 |
| 40-69 | 98 | 57.9 | 46.1-69.6 | 146 | 45.6 | 36.1-55.1 | 244 | 51.7 | 44.0-59.5 |

* A 10-year CVD risk of $\geq 30 \%$ is defined according to age, sex, blood pressure, smoking status (current smokers OR those who quit smoking less than 1 year before the assessment), total cholesterol, and diabetes (previously diagnosed OR a fasting plasma glucose concentration $>7.0 \mathrm{mmol} / \mathrm{l}(126 \mathrm{mg} / \mathrm{dl})$ ).
**Counseling is defined as receiving advice from a doctor or other health worker to quit using tobacco or not start, reduce salt in diet, eat at least five servings of fruit and/or vegetables per day, reduce fat in diet, start or do more physical activity, maintain a healthy body weight or lose weight.

## Summary of Combined Risk Factors

```
Summary of Description:
Combined Percentage of respondents with 0, 1-2, or 3-5 of the following risk factors:
Risk Factors
```

Instrument questions: combined from Step 1 and Step 2

- Current daily smoking
- Less than five servings of fruit and/or vegetables per day
- Not meeting WHO recommendations on physical activity for health (<150 minutes of moderate activity per week, or equivalent)
- Overweight or obese ( $\mathrm{BMI} \geq 25 \mathrm{~kg} / \mathrm{m}^{2}$ )
- Raised BP (SBP $\geq 140$ and/or DBP $\geq 90 \mathrm{mmHg}$ or currently on medication for raised $B P$ ).

| Summary of Combined Risk Factors |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age Group(years) | n | \% with 0 <br> risk factors | $95 \% \mathrm{Cl}$ | \% with 1-2 <br> risk factors | $95 \% \mathrm{Cl}$ | \% with 3-5 <br> risk factors | $95 \% \mathrm{Cl}$ |
